RADE KONCAR KONTAKTORI I RELEI D.O.O.

For more than 70 years we have been building a company that values knowledge, hard work and dedication. With headquarters in Skopje, North Macedonia we have grew into a company that has a worldwide network of satisfied customers and clients in over 40 countries.

We are producing low voltage electrical equipment for industrial applications. Our range of products includes AC-DC contactors from 9A to 1000A (Ac3, 400v 50Hz) with AC or DC control circuit, thermal overload relays, rotary cam switches, push buttons, motor protection breakers, molded case circuit breakers, air type circuit breakers, miniature circuit breakers and electronic time relays. These products are produced in standard configuration, however we can quickly customize our production for the client's unique requests.

Our research and development sector is constantly working on making the design of our products more reliable, flexible and customizable. These efforts are in accordance with all the international standards of production and quality of the products.

We have also successfully developed systems for energy monitoring and management (EMMS), power factor correction units, and system for intelligent street lighting (RK-Light).

Our Quality Management System has been certified by TUV CERT - Certification Body, which means that we are fully compliant with the ISO 9001 standard. Because we care about the environment and our employees, we have also implemented all the necessary policies and procedures for the standard ISO 14001 and ISO 45001.

CONTACTORS

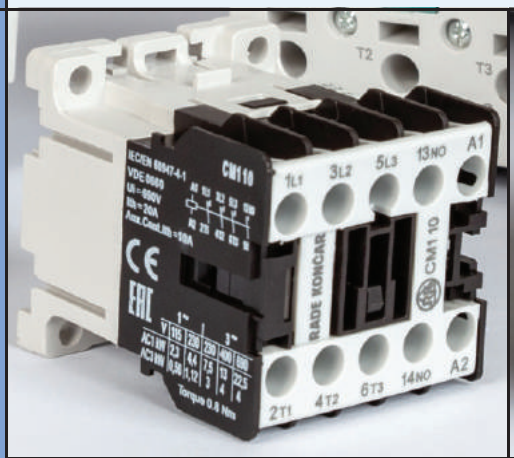
Low voltage contactors



Motor contactors **CNN** series

Application:

Contactors CNN series are using for remote control and protection (in combination with overload relays) of three-phase motors with a nominal power of 4.5 kW to 55 kW (400 V/50 Hz for the use category AC3), and other a.c. and d.c. loads, such as electric ovens, bulbs, electromagnets, capacitors etc.

Advantages:

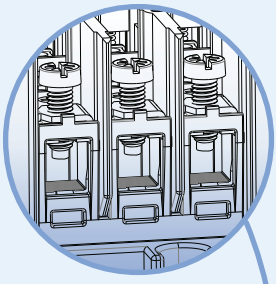
- In conformity with: IEC 60947-1, IEC 60947-4-1
- High performance and reliability
- Low power loss
- Protection of direct contact from front side - IP20
- Large selection of accessories
- Standard control voltages: 24 VAC, 48 VAC, 110 VAC, 230 VAC, 400 VAC
- Installation on DIN rail and mounting plate
- Small mounting dimensions and overall size
- Up to 4 extended auxiliary contacts (1NO + 1NC or 2NO + 2NC)
- Snap on auxiliaries

Ordering:

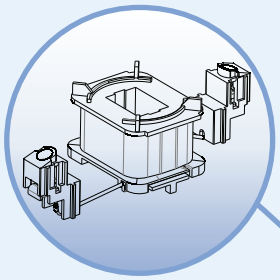
CNN	9	1	0	220/230V	50Hz
1	2	3	4	5	6

1 - Contactor series
2 - Rated operational current Ie (AC3,400V/50Hz)
3 - Number of NO auxiliary contacts
4 - Number of NC auxiliary contacts
5 - Control voltage (coil voltage)
6 - Frequency of the control voltage

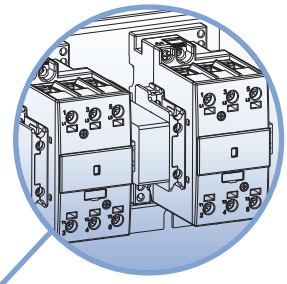
Possibilities



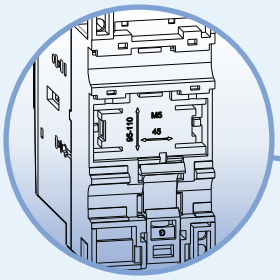
Special clamp terminals are provided for reliable connection of conductors for CNN 50 - CNN 100



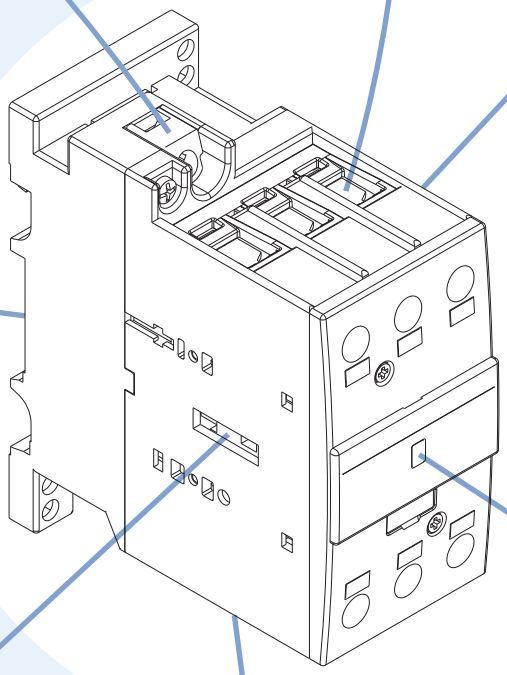
Wide range of coil voltages are provided. The users can change the coil by themselves. AC and DC coils are not compatible with each other. Possible is only the replacement of AC coils with AC and DC coils with DC.

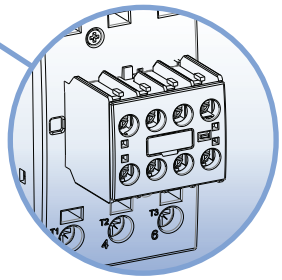


Mechanical interlock is used to prevent the contactors from being energized simultaneously or closing together and causing a short circuit

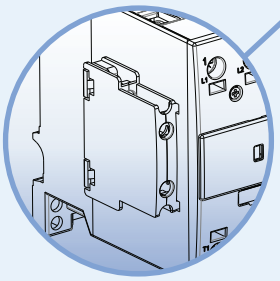


Contactors type CNN can be mounted on DIN rail or directly on the mounting plate. Type CNN 9 to CNN 40 DIN rail 35mm and type CNN 50 to CNN 100 DIN rail 35mm or 75mm

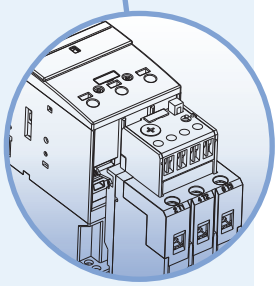




Auxiliary contacts (front mounting)



Auxiliary contacts (side mounting)



Overload relay (bimetal) can be mounted directly on the contactor or on special carrier adapter.

Reversing contactor assemblies

Application:
Mechanical interlock is used to prevent the contactors from being energized simultaneously or closing together and causing a short circuit

Features:

- Mechanically and electrically interlocked
- Includes power wiring
- DIN rail mounting for MBCNN 9 - MBCNN 40
- Utilizing contactors with snap-on auxiliary contact blocks

Reversing contactor MBCNN 9	9A/4.5kW (AC3,400V/50Hz); 25A (AC1) 9A/1.9kW (AC4,400V/50Hz); 25A (AC1)

Coil CNN 100 220V DC	606498	DC			

Replacement only AC coils with AC and DC coils with DC.

Technical data - page 62

Motor contactors **CNM** series

Main contacts of the contactor for managing the electric loads (motors and other loads) for nominal power of 55 kW to 580 kW (400 V/50 Hz for the use category AC3).
Possibility of overload protection using overload relays (bimetals).
In conformity with: IEC 60947-1, IEC 60947-4-1
Rugged construction

Auxiliary contacts:
- CNM 110 to CNM 400 up to 8 auxiliary contacts, 4 on each side (2NO + 2NC or 4NO + 4NC)
- CNM 450 to CNM 860 4 auxiliary contacts
- CNM 1000 3 auxiliary contacts

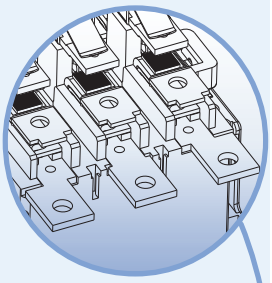
Ordering:

CNM	110	2	2	220/230V	50Hz
1	2	3	4	5	6

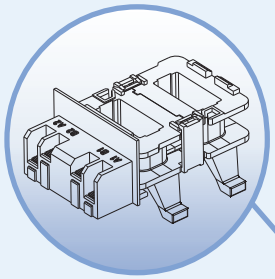
1 - Contactor series
2 - Rated operational current Ie (AC3,400V/50Hz)
3 - Number of NO auxiliary contacts
4 - Number of NC auxiliary contacts
5 - Control voltage (coil voltage)
6 - Frequency of the control voltage

Technical data - page 62; Accessories - page 24

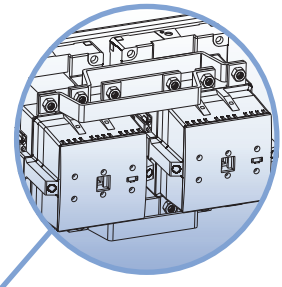
Possibilities



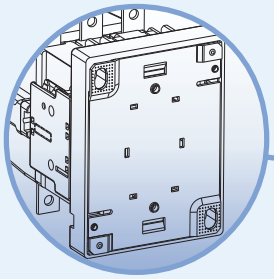
Wide terminals sections are provided for reliable connection of conductors



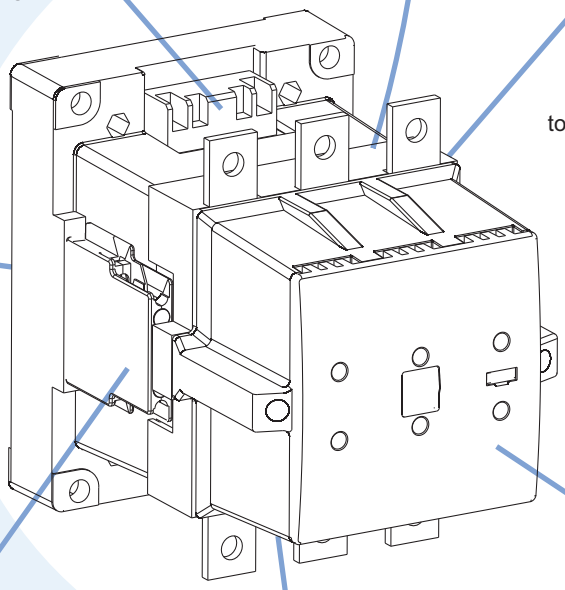
The users can change the coil by themselves. AC and DC coils are not compatible with each other. Possible is only the replacement of AC coils with AC and DC coils with DC.

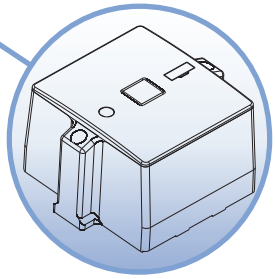


Mechanical interlock is used to prevent the contactors from being energized simultaneously or closing together and causing a short circuit

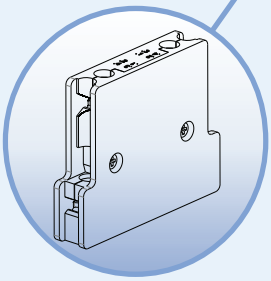


Contactors type CNM can be mounted directly on the mounting plate

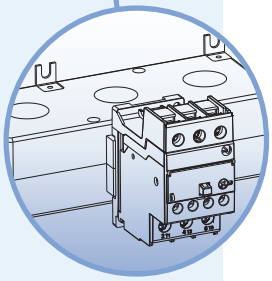




The users can change arc chamber by themselves



Auxiliary contacts (side mounting)



Overload relay (bimetal) is connected with the contactor with appropriate cable conductor

2 auxiliary contacts (1NO + 1NC)

Reversing contactor assemblies

Application:
Mechanical interlock is used to prevent the contactors from being energized simultaneously or closing together and causing a short circuit

Features:

- Mechanically and electrically interlocked
- Includes power wiring
- Utilizing contactors with fixed auxiliaries

Coil CNM 400 220V DC	155627S	DC			

Replacement only AC coils with AC and DC coils with DC.

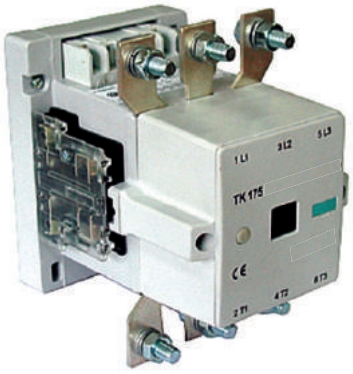
Technical data - page 62

Contactors for resistive loads **TKN** and **TK** series

Application:
Contactors are using for remote control resistive loads with a nominal power of 43 kW to 115 kW (400 V for the use category AC1).

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-4-1
- Switching resistive loads at 55°C
- Rugged constaction
- High performance and reliability
- Low power loss
- Standard control voltages: 24 VAC, 48 VAC, 110 VAC, 230 VAC, 400 VAC



Ordering:

TKN	65	0	0	220/230V	50Hz
1	2	3	4	5	6

1 - Contactor series
2 - Rated operational current Ie (AC1)
3 - Number of NO auxiliary contacts
4 - Number of NC auxiliary contacts
5 - Control voltage (coil voltage)
6 - Frequency of the control voltage

Accessories and spare coils for TK contactors see page 24-26

Capacitor contactors **CNNK..N** series

Precharging resistors are an integral component of the CNNK..N contactors, equipped with early-make contacts. This special type of contacts has the purpose of connecting for a very short time up to 5ms, during the contactor closing resistors which limit the connecting current of the capacitors. These resistors are then excluded when the closing operation is complete and the current capacity is conveyed to the main contacts. With this type of circuit, it is possible to obtain minor wear of all the components of the system especially fuses and capacitors ensuring a longer life and better reliability. Suitable for capacitors with and without reactor protection.

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-4-1
- Installation on DIN rail and mounting plate
- Switching of 3 phase capacitors
- Ambient temperature of 55 ^{0}C
- Maximum permissible peak current I ≤ 200 Ie
- For contactors without resistors maximum permissible peak current I ≤ 100 Ie
- Standard control voltages: 24 VAC, 48 VAC, 110 VAC, 230 VAC, 400 VAC
- Up to 2 extended auxiliary contacts (0NO + 1NC or 1NO + 1NC)
- Space saving: 45mm width up to 30kVAr
  55mm width up to 60kVAr
  70mm width up to 75kVAr

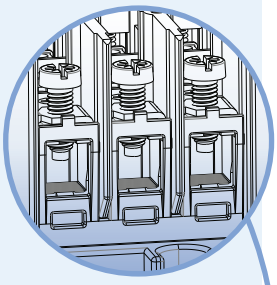
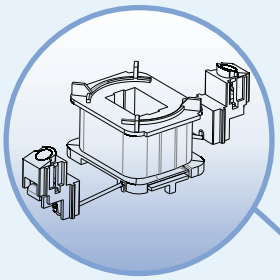
5 - Control voltage (coil voltage)
6 - Frequency of the control voltage

Technical data - page 82; Accessories - page 36

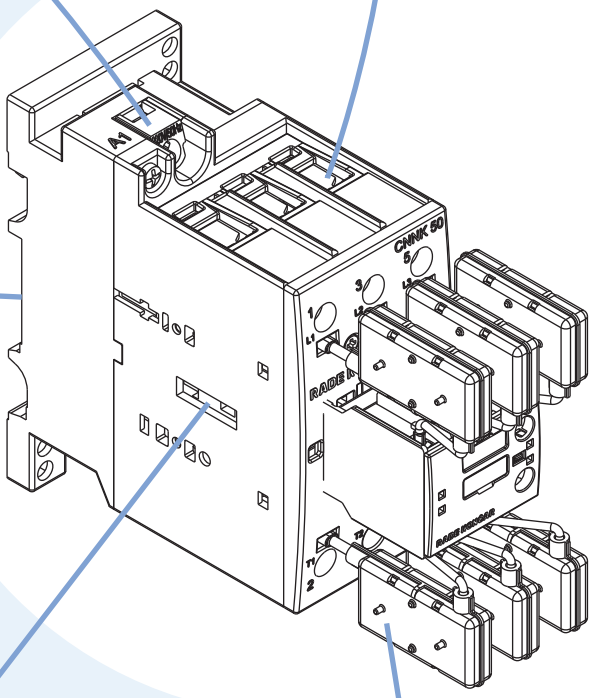
Possibilities

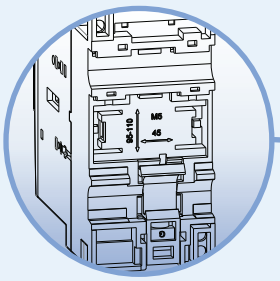


Special clamp terminals are provided for reliable connection of conductors for CNNK 40 - CNNK 75

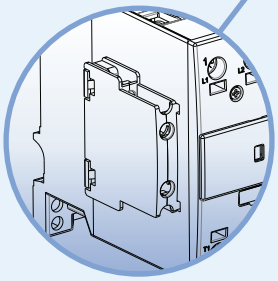


Wide range of coil voltages are provided. The users can change the coil by themselves.

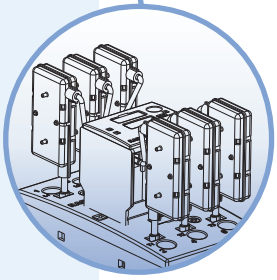




Contactors type CNNK can be mounted on DIN rail or directly on the mounting plate. Type CNNK 10..N to CNNK 30..N only DIN rail 35mm and type CNN 40..N to CNNK 75..N DIN rail 35mm or 75mm



Auxiliary contacts - side mounting



Precharging resistors with special type of contacts has the purpose of connecting for a very brief interval, up to 5ms, during the contactor closing, resistors limit the connecting current of the capacitors

Up to 2 extended auxiliary contacts can be added on the contactors CNNK..N series (max. 1NO + 1NC)

Mini motor contactors **CM1**

Application:

Contactors are using for remote control and protection of electrical engines and other electrical consumers with a nominal power of 4 kW to 5.5 kW (400 V/50 Hz for the use category AC3).

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-4-1
- Small mounting dimensions and overall size
- Installation on DIN rail and mounting plate
- High performance and reliability
- Low power loss
- Protection of direct contact from front side - IP20
- Large selection of accessories
- Standard control voltages: 24 VAC, 48 VAC, 110 VAC, 230 VAC, 400 VAC
- Up to 4 extended auxiliary contacts
- Snap-on auxiliaries

integrated auxiliary contact 1NO or 1NC

Reversing contactor assemblies

Application:
Mechanical interlock is used to prevent the contactors from being energized simultaneously or closing together and causing a short circuit

Features:

- Mechanically and electrically interlocked
- Includes power wiring
- DIN rail mounting
- Utilizing contactors with snap-on auxiliary contact blocks

Main and control circuits are wired according to the circuits diagrams on page 90

4-pole contactors **CNN** (2NO + 2NC) main poles

Remark for (CNN 9 0022...CNN 12 0022) 4-pole contactors fitted with 2NO + 2NC main poles
These contactors are suitable for controling 2 separate circuits, i.e. 2 loads with 2 separate supplies, or 1 circuit comprising 2 separate loads with a single supply (see diagrams below). When the contactor operates there is no mechanical overlapping between the N.O. poles and the N.C. poles: BREAK before MAKE.
In conformity with: IEC 60947-1, IEC 60947-4-1
These contactors are not suitable for reversing starter or star-delta starter or for controlling a single load from 2 separate supplies.

Block diagrams:

Single supply and 2 separate loads

Contactor relays **CP0** and **CNNP**

Application:

Contactors are using for closing and opening operations of the control circuit as well as for the control of small size motors and other a.c. and d.c. loads with a operational current of 6 A (for the use category AC 15/AC 14).

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-5-1
- Small mounting dimensions and overall size
- Installation on DIN rail and mounting plate
- High performance and reliability
- Low power loss
- Protection of direct contact from front side - IP20
- Large selection of accessories
- Standard control voltages: 24 VAC, 48 VAC, 110 VAC, 230 VAC, 400 VAC
- Up to 6 extended auxiliary contacts for CP0
- Up to 8 extended auxiliary contacts for CNNP
- Snap-on auxiliaries

Motor contactors with DC solenoid system **CNNB** series

Application:

Contactors are suitable for d.c. operated (special electromagnet) and for particular conditions of application where reduced noise at closing operation and complete elimination of noise in closed position are required. Motor contactors are using for remote control and protection of electrical engines and other electrical consumers with a nominal power of 4.2 kW to 11 kW (400 V/50 Hz for the use category AC3).

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-4-1
- Installation on DIN rail and mounting plate
- High performance and reliability
- Low power loss
- Protection of direct contact from front side - IP20
- Large selection of accessories
- Standard control voltages: 24 VDC, 48 VDC, 60 VDC, 110 VDC, 220 VDC
- Snap-on auxiliaries
- For front mounting up to 4 auxiliary contacts (2NO + 2NC)
- For side mounting up to 2 auxiliary contacts (1NO + 1NC)

Contactor relay with DC solenoid system **CNNPB**

Application:

Contactors are suitable for d.c. operated (special electromagnet) and for particular conditions of application where reduced noise at closing operation and complete elimination of noise in closed position are required. Contactor relays are using for closing and opening operations of the control circuit as well as for the control of small size motors. Rated operational current of 6 A/230V 50Hz (for the use category AC 15/ AC 14).

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-5-1
- Installation on DIN rail and mounting plate
- High performance and reliability
- Low power loss
- Protection of direct contact from front side - IP20
- Large selection of accessories
- Standard control voltages: 24 VDC, 48 VDC, 60 VDC, 110 VDC, 220 VDC
- Snap-on auxiliaries
- For front mounting up to 4 auxiliary contacts (2NO + 2NC)
- For side mounting up to 2 auxiliary contacts (1NO + 1NC)

Star-delta starters in enclosures

Star - delta starters are used for starting three-phase induction cage motors which are not overloaded during the starting. When starting, the windings of the stator are connected to the mains in a position of a start. After the starting operation they assume a delta position. Due to this change of the position of the windings the value of the starting current of the motor is 0,58 of the current of direct starting in delta position of the windings. When starting the motor in this way the starting moment is three times shorter , so this starters can only be used for motors whose starting moment , due to lack of overloading, is much shorter , and for those starting in idle or under light load. The windings can change their start position into a delta position after the motor achieves a nominal numbers of rotations. Motors which require an early change of the position of the windings cannot be started with SDS type of starters.

In table 1 quoted currents and capacities are valid only if special star-delta timer EVRK 40 is used.

The change of the windings from star position to delta position occurs automatically after the starting operations is over. Starting can be adjusted to last from 2-20 s with a switch delay of about 100ms by means of an embedded timer.
The thermal overload relay can operate accurately during permanent duty if the number of starts per hour does not exceed 15, and during intermittent duty (with 40% working time) if the number of starts per hour does not exceed 60.

Overload protection
The thermal overload relay is set to cca 0,58 x motor rated current.
Technical data for current range of thermal overload relays are given in table 2.

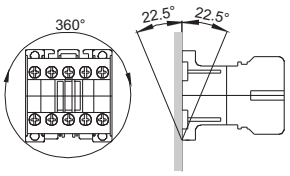
Technical data

Standards

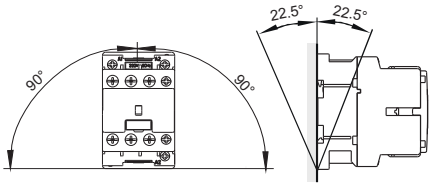
Motor and capacitor contactors CM1, CNN, CNM and CNNK
are in comformity with IEC 60947-4-1 and EN 60947-4-1.
Contactor relays type CPO, CNNP and CNNPB are in conformity with
International standard IEC 60947-5-1 and EN 60947-5-1
Designations of contactors, conform to EN 50 005, EN 50 012.

Installation

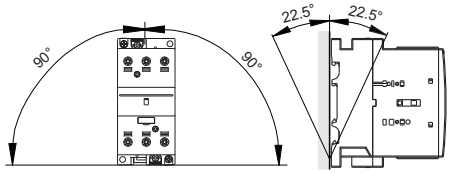
Contactors can be mounted on the baseplate with two or four screws. Contactors type CPO, CNNP, CNNB, CNB, CM1, CNN 9 - 100 and CNNK 2.5 - CNNK 75..N are designed for quick installation on vertical standard support 35 mm width and CNN 50 - 100 and CNNK 40..N - CNNK..75N on 75 mm width according to DIN EN 50022. Permissible deviations of mounting surfaces from the vertical base are shown on sketches:



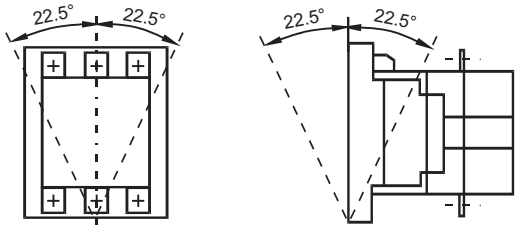
CM1,CP0



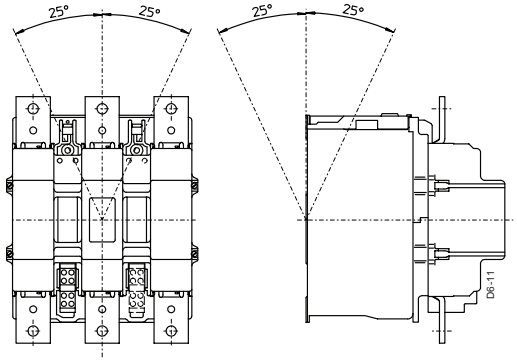
CNN 9 - CNN 40 , CNNK 2.5 - CNNK 30..N, CNNP and CNNB 9 - CNNB 30



CNN 50 - CNN 100, CNNK 40..N - CNNK 75..N



CNM 110 - CNM 400
CNKM 80



CNM 450 - CNM1000

Electrical endurance of the main contacts

The characteristic curves show the contact endurance of the contactors when used to switch resistive and inductive three-phase loads (AC1/AC3), depending on the breaking current and rated operational voltage it is assumed that the operating mechanisms are switched randomly, i.e. Not synchronized with the phase angle of the supply system.
The rated operational current Ie for the AC4 utilization category (breaking six times the rated operational current) is designed for a contact endurance of approximately 120 000 operating cycles if a shorter endurance is sufficient, the rated operational current Ie/AC4 ca be increased.
For mixed operation, i.e. normal switching (breaking the rated operational current according to the AC3 utilization category) in combination with intermittent inching (breaking several times the rated operational current according to the AC4 utilization category),

the contact endurance can be calculated approximately from the following equation:

$$X = \frac{A}{1 + \frac{C}{100}\left[\frac{A}{B} - 1\right]}$$

Where:
X - Contact endurance for mixed operation in operating cycles
A - Contact endurance for normal operation (Ic=Ie) in operating cycles
B - Contact endurance for inching (Ic= multiple of Ie) in operating cycles
C - Inching operations as a percentage of total switching operations

1) By plugging is understood stopping or reversing the motor rapidly by reversing motor primary connections while the motor is running.
2) By inching (jogging) is understood energizing a motor once or repeatedly for short periods to obtain small movements of the driven mechanism.
3) Tests to be carred out with an incandescent light load.
4) p.f.=0,45 for Ie ≤100 A ; 0,35 for Ie > 100 A.

I - making current
U - voltage before breaking
Ie - rated operational current
Ue rated operational voltage
Ic - breaking current
Ur - recovery voltage
P = Ue x Ie (W)

Degrees of protection for enclosed equipment

In an installation, the degree of protection required for electrical equipment depends of the environmental characteristics. The degree of protection, ensured by the enclosure of equipment or by the cubicle containing the equipment is expressed by the IP code which gives the level of protection against access to hazardous parts, the ingress of foreign bodies and/or the ingress of water, in compliance with IEC 529, EN 60529, IEC 60947-1 and EN60947-1.Besides the IP symbol,the complete code has two figures followed (optionally) by two additional letters. A short description of the elements used in IP coding is given below.

Element	Figures or letters	Specifications for installation protection	Protection of personnel
Codes		**IP**	
First figure		**Against ingress of foreign bodies**	**Against access to hazardous parts with**
	0	No protection	Non-protected
	1	Diameter ≥ 50 mm	Back of hand
	2	Diameter ≥ 12,5 mm	Finger
	3	Diameter ≥ 2,5 mm	Tool
	4	Diameter ≥ 1 mm	Wire
	5	Limited protection against dust	Wire
	6	Total protection against dust	Wire
Second figure		**Against entrance of water having a harmful effect**	
	0	No protection	
	1	Vertical dripping	
	2	Dripping up to 15^0 from the vertical	
	3	Rain at a vertical angle of $\leq 60^0$	
	4	Splashing from all directions	
	5	Hosing jets from all directions	
	6	Strong hosing jets from all directions	
	7	Temporary immersion	
	8	Permanent immersion	
Additional letter (opt.) **for use with:**		**Against ingress of foreign bodies**	**Against access to hazardous parts with**
First figure 0	**A**	Stopped by a barrier with a 50 mm ϕ sphere	Back of hand
First figure 0 or 1	**B**	Entrance of test finger limited to 80 mm	Finger
First figure 1 or 2	**C**	Wire with 2.5 mm ϕ and length of 100 mm	Tool
First figure 2 or 3	**D**	Wire with 1 mm ϕ and length of 100 mm	Wire
Additional letter (opt.)		**Specific additional information**	
	H	High voltage apparatus	
	M	Moving parts which are moving during water test	
	S	Moving parts which are stationary during water test	
	W	Specifed atmospheric conditions	

Note: The type of enclosure or cubicle in which the equipment must be installated prevails with respect to the degree of protection.

Over voltage limiter (surge suppressors)

When cutting off the inductive circuits the over voltage appears. The over voltage can damage used equip ment that is why it is useful to limit the amplitudes and duration of the over voltage with some of the blocking systems. In practice this overvoltages may disconnect the coil of the contactor. Cutting off the coil (wounding) is connected with high frequencies and remarkable amplitudes (several KV) but regularly with short duration. With reference to the place of the implementation, it is frequently necessary to limit the over voltage, because they can cause problems such as:

Radio interference
- Interference with the electronic devices and components (programmable automation)
- Damage of the electronic systems and components (diodes, bridges, etc.)
-

The most often used systems for over voltage blockade are:

R-C elements
- Varistors
- Diodes (with or without resistor in serial)
-

The advantages and disadvantages when using these elements are following:

R-C Advantages

Theoretically can be used with AC and DC circuits
- Big limitation of voltage peaks
- Time stability of R-C elements
-

Disadvantages

Resonance
- Limited infuence on the period of activating contactor
- Contactors with DC magnet swith out current limiting resistor, difficulties with limiting overvoltage
- due to big powers.

Varistors Advantages

Very short period of cutting off, so that there is no infuence on the contactor activity
- Without resonance
- Usage in AC and DC circuits
-

Disadvantges

Not enough limitation of voltage peaks
- Growing old equipment because of prolonged thermal loading
-

Diodes Advantages (see page 1/30)

Optimal muffing
-

Disadvantges

Delay when cutting off
- Only DC circuits
-

Voltage drop in main circuits and current transformers

When the distance between the energy source and the consumer is long, it is advisable to calculate the voltage drop for example at the moment of starting the motor (when tripping current gets peak value) and to check if the remaining voltage is in the consumers working limits.
For calculating the voltage drop the following formula has been used:

$\Delta V = \Delta V_0 * L * I$

Where ΔV = voltage drop in Volts
ΔV_0 = unit voltage drop from table
L = cable length in km
I = current

This formula is valid for calculating the voltage drop for motors, when insuffcient voltage disable running up the motor.
In the table below are listed active and reactive resistances of the cables for calculating the voltage drop when the power factor is different from 0.8. In that case the following formulas should be used:

Single phase $\Delta V = 2\ I*L\ (\cos f + X_l \sin f)$
Three phase $\Delta V = \sqrt{3}\ I*L\ (\cos f + X_l \sin f)$

Rated cross-section	**Single wire cable** active resistance r	reactive resistance x	**DC**	**AC** cosf = 0,8 1 fase	3 fases	**Two and three wire cable** active resistance r	reactive resistance x	**DC**	**AC** cosf = 0,8 1 fase	3 fases
[mm²]	[Ω /km]	[Ω /km]	ΔV [V/Akm]	ΔV [V/Akm]	ΔV [V/Akm]	[Ω/km]	[Ω/km]	ΔV [V/Akm]	ΔV [V/Akm]	ΔV [V/Akm]

Current transformers

Typical for the current transformers is that the power on the secondary has got influence on the precsion of the transmitting ratio as big as the phase angle.
The power of the secondary in the current transformer is made by the impendence of cables and attached instruments. The cable consumption is shown in the table below.

Secondary coil	**Consumption per meter of the two-wire cable at 20 °C** for different cross section 1 mm²	1,5 mm²	2,5 mm²	4,5 mm²	6 mm²	10 mm²	16 mm²
A	VA	VA	VA	VA	VA	VA	VA
5	1	0,685	0,41	0,254	0,169	0,0975	0,062
1	0,04	0,0274	0,0164	0,0102	0,0068	0,0039	0,0025

NOTE: Each temperature increased for 10°C is followed by increasing of the consumption in VA for 4%.
Consumption of instruments is defined by the producer. Here are listed just informative values for some instruments.

Electromagnetic ammetar	1,1 VA	Cos f - meter	0,5 VA	Counter	0,5 VA
Wattmeter - Varmeter	0,5 VA	Ammeter - printer	0,5-1,5-2,5 VA	Wattmeter - printer	0,5 VA

Auxiliary current circuits

Voltage drop in auxiliary current circuit

The maximal cable length with allowed maximal voltage drop of 5 % for AC and DC circuits is calculated from the formula:

$L = L_0 / P$ where is:
L = Maximal cable length in km
L_0=Cable coefficient depending on the voltage drop and the cross section
P = Active load power when tripping (for AC=VA cosf)

The maximal length of the cable depends on the allowed voltage drop and it is changing proportionally. Ex. for 10 % voltage drop the cable length should be doubled.

NOTE: The voltage drop is not dependent only on the length and the cross section of the cable, but as well on all other resistances (clamps, contacts), which are connected in the auxiliary circuit.

Rated cross-section [mm^2]	Coefficient L_0					
	24V [kmW]	48V [kmW]	110V [kmW]	220/230V [kmW]	380/400V [kmW]	500V [kmW]
1,5	1,08	4,32	22,7	90,8	272	471
2,5	1,80	7,20	37,8	151	453	785
4	2,88	11,5	60,5	242	725	1260

Cable capacity

If the length of the cables in the auxiliary current circuits is excessive the voltage drop is not only the one that should be considered but the cable capacity as well. The cable capacity can get such a high value to hold the contactor closed even when the voltage is cut off.

The control circuit confguration is shown below (permanent contact control) in the case of two-wire cable.
This effect is more expressed at small auxiliary relays where is required smaller energy for holding in closed position.
The conductor's critical capacity and appropriate critical length of the conductors for nominal control voltage
(coil voltage) 220 V, 50 Hz, at permissible 10% increasemant of control voltage.

Contractors (Type)	Critical conductor capacity (µF)	Critical conductor length (m)	(m)

Control of lighting circuits

General

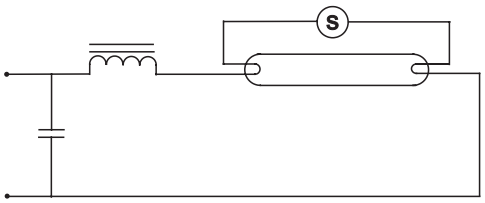
- Contactor choice criteria for control of lighting circuits are as follows:
- Type, power rating and number of lamps
- Connection mode
- Current values on closing and in steady state
- Power factor cosf of the lamps
- Presence or not of compensation capacitors

Lighting circuits

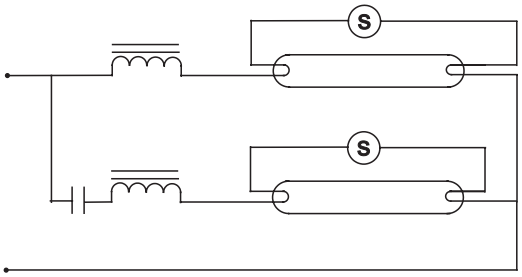
In a given circuit,the number and power rating of lamps are defined and cannot result in overload. Only short-circuit protection has to be provided. GG fuses or modular circuit-breakers will be chosen for this purpose.The lamps have very specifc technical data,according to their construction type.

- Incandescent lamps have a very high current on clossing: more than 15 times normal current. They do not introduce a large phase displacement beween current and voltage.
- Fluorescent tubes are equipped with a ballast whose purpose is two-fold: conttribute to ignition and limit current to nominal value once steady state is reached. This ballast is a reactor that considerably lowers the power factor. It may or may not be compensated.

Individual compennsation mounting



Serial compensation in dual



Choice of contactors

The following tables indicate, for each contactor type, the maximum permissible number of lamps per phase.

Air temperature, near the contactor, must be limited to 55^{0}C.

Number are given for a 230 V voltage distributed between phase and neutral: single-phase (phase + neutral) or three-phase (3 phases + neutral) distribution.

In the case of a three-phase supply without neutral, 230 V phase- to-phase, the permissible number of lamps per phase will be that given in the tables multiplied by 0,58.

Table of technical characteristic for lighting switching

Type of lamps	compensation	Start curret x In[1]	cos φ	Starting time s	Important for choosing contactor type
Light gas lamp connection	without	1	0,5	-	Rated continuous current Ith[2] (A)

Capacitor contactor type CNNK 2.5 - CNNK 12.5

In confomity with: IEC 60947-1, IEC 60947-4-1

Choice criteria

The contactor during the closing transition is influenced by electrical currents with high frequencies and high amplitudes. The frequencies of these currents have ranges between 1 and 10kHz and the amplitudes must have values lower than the maximum permissible peak current I ≤ 100 times the nominal rms current of the switched capacitor.

Capacitor contactors type CNNK 10..N - CNNK 30..N

In confomity with: IEC 60947-1, IEC 60947-4-1

Main characteristics

These contactors are equipment with early - make contacts. This special type of contact has the purpose of connecting for a very brief interval, up to 5 ms, during the contactor closing, resistors which limit the connecting current of the capacitors. These resistors are then excluded when the closing operation is complete and the current capacity is conveyed to the main contacts. Maximum permissible peak current 1≤200 times the nominal rms current of the switched capacitor.

CNKM 80

VERY IMPORTANT NOTES:

For single compensation air coils or 3 - phase reactors (coils with magnetic core and air gap) are not necessary.

When the contactor is used for group compensation it is recommendable to use appropriate 3-phase filter circuit reactors (coils with magnetic core and air gap).
This will reduce the value of higher harmonics and will prevent resonant current to prevail.

For single compensation the power of selected contactor is according to capacitor rated power.

For group and central compensation, when reactors are not in use, one step higher rating of the contactor is recommendable.

Maximum permissible peak current 1≤200 times the nominal rms current of the switched capacitor.
Switching onto discharged capacitors is permitted with CNNK contactors. (the voltage at the terminals must be < 50 V).

Manual operation for function tests is not permitted. The series resistors must not be removed. During exploitation, current value must not exceed the declared values.

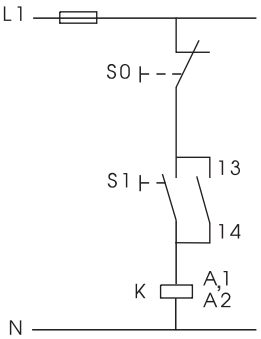
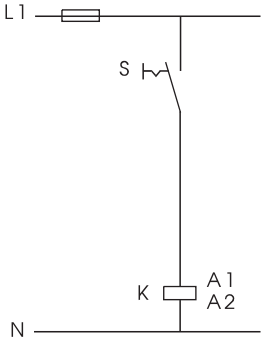
Schematic diagrams for AC operated contactors

CPO, CNNP, CM1, CNN 9 - CNN 100, CNM 110 - CNM 400



With push button "S0, S1"



With permanent contact switch "S"

IMPORTANT:

When used in **star-delta starters** the time between change over connection from star to delta must be bigger than 100ms which is achieved with electronic time relays (e.g. **Rade Koncar type EVRK 40**).

THERMAL OVERLOAD RELAYS

Thermal overload relays

Thermal overload relays

Application:
Thermal overload relays TM and TRM are designed to protect low voltage motors and other consumers against nonpermissible overloads and phase-failure operations.

Advantages:

- In conformity with: IEC 60947-1, IEC 60947-4-1
- Ambient temperature compensated
- Differential tripping
- Selective manual or auto reset
- Trip indication
- Auxiliary contacts (1NO + 1NC)
- Small mounting dimensions and overall size

Ordering:

TM 40 (1) 16A (2)

1 - Type
2 - Overload setting range (Upper value)

Technical data - page 104

Rotary Cam Switches series BS

ROTARY CAM SWITCHES "BS"

Rotary cam switches series "BS" are intended for multiple switching operations in main as well as in auxiliary circuits. As motor switches they are designed for direct-online starting and stopping of single-phase and three-phase motors. They also come out as star-delta switches, reversing switches, pole-change over motor switches. In auxiliary circuits they are assembled in compliance with the switching programme according to preference: switches for control, signalling and measuring circuits. Switches, selector switches and step switches e.g. for transformers and welding apparatuses. Group switches e.g. for switching operations of resistors and heaters. Control switch with automatic return The advantages of rotary cam switches are: high making and breaking capacities, electrical and mechanical endurance and small dimensions. Rotary cam switches comply with international standards such as: IEC 60947-3 and EN 60947-3. The rotary cam switches "BS 16" to "BS 63" can have 24 contacts (12 switching elements) maximum and can be made with turning angle of 30, 45, 60 and 90 degrees.The rotary cam switches "BS 80" and "BS 100" can have 24 contacts (12 switching elements) maximum and can be made with turning angle of 45, 60 and 90 degrees.The rotary cam switches "BS" 125 to "BS 630" can have 18 contacts (9 switching elements) maximum and can be made with turning angle of 60 and 90 degrees.

UTILIZATION CATEGORY

Category	Utilization
AC-20	Connecting and disconnecting under no-load conditions
AC-21	ON-OFF switching of resistive loads, including moderate overloads
AC-22	Switching of mixed resistive and induktive loads, including moderate overloads
AC-2	Staring slip-ring motors and plugging
AC-23	Switching of motor loads or other highly induktive loads
AC-3	Starting squirrel-cage motor and switching off motors when running
AC-4	Starting squirrel-cage motors, plugging, inching, reversing
AC-15	Control switch for switching magnetic devices, contactors, valves

ORDERING INFORMATION

When ordering please define:

1.- Switch type
2.- Number of schematic diagram
3.- Mounting form (for front "U" or rear mount "O"
4.- Front part - Optional:

PS - (handle black and front plate model PS) - on request.
LK - (red knob and yellow plate for main emergency on - off switch).
ES - (handle-red and front plate-yellow)

EXAMPLE:

1	2	3
BS 25	10	U

Type **- BS 25**, schematic diagram **- 10,** mounting form **- U,** with standard **black** handle and front plate standard **gray**.

1	2	3	4
BS 40	10	U	PS

Type **- BS 40,** schematic diagram **- 10,** mounting form **- U,** with black handle and PS front plate.

1	2	4
BS 63	10	LK

Type **- BS 63,** shematic diagram **- 10,** Main emergency on-off switch with 3 padlock facility in "0" position **- LK**

"ES" - GENERAL EMERGENCY ON - OFF SWITCH

GENERAL EMERGENCY ON - OFF SWITCH VERSION “LK” WITH PADLOCKING ONLY IN "0"

- Emergency switch have to make electrical separation beetwen el. supply and electrical equipment.
- Control handle according the Standards is Red, and the plate behind the handle yellow.
- Emergency switch is able to lock in the open position "0" up to three padlocks.

DIMENSIONAL DRAWINGS VERSION “LK” (mm)

SWITCHES WITH SPECIAL SWITCHING PROGRAM

When ordering cam switches with special switching program that are not included in the catalogue, the purchaser is required to submit a developed diagram for switching of contacts. For this purpose we have created an order form, which besides the diagram, purchaser should fill in data for rated current, rated voltage, utilization category, mounting form, type of handle, special version and marks on the front plate.
Example of filled order form.

Order Sheet for special rotary cam switches

RADE KONČAR KONTAKTORI I RELEI

Voltage 400 V/50Hz | Power 15 kW | Current 29 A | Utilization category AC 23 | Mounting form ☒ U Front ☐ O Rear

PUSHBUTTONS AND INDICATOR LIGHTS - PBN

Pushbuttons and indicator lights

Pushbuttons and indicator lights

PUSHBUTTONS AND INDICATOR LIGHTS - PBN

Push-button is a control switch having an actuator intended to be operated by force exerted by a part of the human body, usually the finger or palm of the hand, and having stored energy (spring) return. push-buttons communicate information, both ways. It sends information from the human to the machine (trning it on and off) and from the machine to the human (current state of the machine). Pilot devices are widely spread products and can be found in residential, commercial and industrial buildings.

Rade Koncar Kontaktori I Relei offers a wide range of push-buttons and indicator lights like flat and extended pushbuttons, toggle switch, selector switches, double pushbuttons, pilot lights and buzzers, mushrooms and other. We also have insulated enclosures to insulate the product.

TECHNICAL DATA

Mechanical life

Pushbuttons	0.5 million operations
Toggle switches	0.3 million operations
Mushroom pushbuttons	0.5 million operations
Selector switches	0.5 million operations
Double pushbuttons	0.5 million operations

Illumination block

Base	Ba9s
Max.permissible power	2W

Temperature

Ambient temperature during operation	-5^0 to $+40^0$C

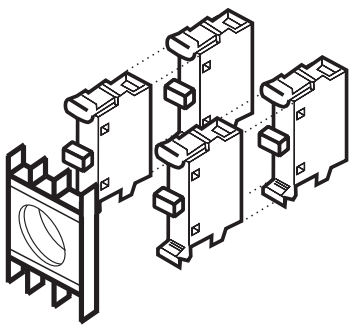
Terminals

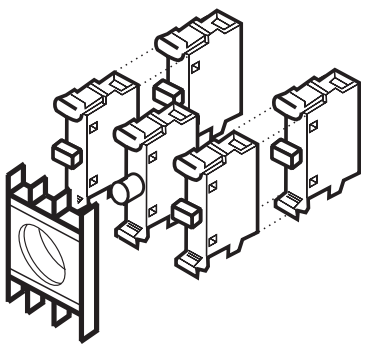
Connection cable cross-section	$1.5mm^2$ - $2.5mm^2$
Recommended torque	0.8Nm

Contact blocks

Mechanical endurance	0.5 million operation
Electrical endurance	0.1 million operation
Rated insulation voltage	300V
Rated operational current Ie	4A
Rated operational voltage Ue	250V AC
Protection degree	IP20 (IP50 if the product is in panel)
Operating frequency	without load 3000 operations/hour; at full load 1200 operations/hour
Switching power in AC15	1000VA 1kA

Max. Number of contact blocks per button





Buttons type PBN 22 IEC 60529; IEC 60947-5-1
- Non- standard schemes can be produced on request of the clients.

MOTOR PROTECTION CIRCUIT BREAKER

Motor protection circuit breaker

Motor protection circuit breaker

MOTOR PROTECTION CIRCUIT BREAKER

Motor protection circuit breakers are a specialized type of electrical protection device that are designed specifically for electric motors, like their name implies. Electric motors have plenty of applications and are used to drive mechanical devices of all types, so it is very important to protect them adequately with MPCBs. In all of these industrial and commercial applications of electric motors, the MPCB has the key role of providing electrical protection. The following are just a few examples of devices driven by electric motors in commercial and industrial buildings:

- Rooftop air conditioners, chillers, compressors, heat pumps and cooling towers.
- Extraction and injection fans, as well as air handling units.
- Water pumping systems.
- Elevators and other hoisting devices.
- Industrial conveyor belts and other machinery used in manufacturing processes

Features:
- With overload and short circuit release
- Ambient temperature compensated
- Phase failure protection
- In conformity with IEC 60947-4-1 and EN 60947-4-1
- Wide range from 0.1 - 25 A
- Compact dimensions, consumes less panel space

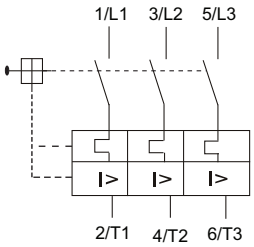
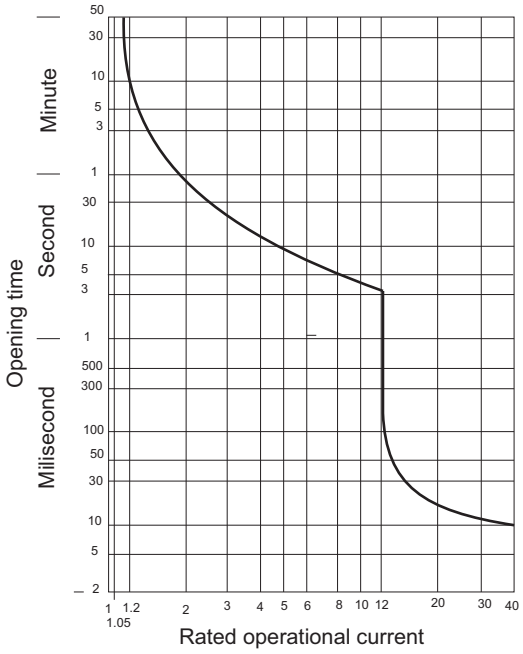
Standard	**IEC 60947-4-1; EN 60947-4-1**
Protection degree	IP40



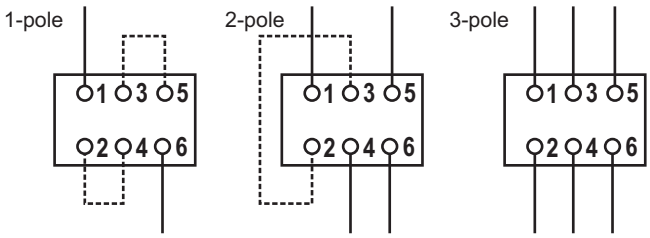
Schematic diagram DMS 25



Tripping Characteristics

The tripping characteristics show the tripping time in relation to the response current. They show main values of the tolerance range at an ambient temperature of 20 ^{0}C, starting from cold. The tripping of overload releases at operational temperature is reduced to approximately 1/4 of the shown. Specific characteristics for each individual setting range are available on request.

Connection diagram



Mounting position: normally any.
Tightening torque for terminal screws:
- Main terminals: 1.2 Nm
- Auxiliary terminals: 1 Nm
- Pollution level III/3

Rated frequency: 40...60 Hz
Heating losses due to the current: 6 W
Switching Times at Short Circuit DMS 25
- Minimum command Time ms 2
- Opening Delay ms 2
- Opening Time ms 7

Utilization Category AC 3 max. 690 V

MOLDED CASE CIRCUIT BREAKERS - KP

Molded case circuit breaker

Molded case circuit breakers - KP

MOLDED CASE CIRCUIT BREAKERS - KP

Molded Case Circuit Breaker as devices designed to open or close a circuit by nonautomatic means and to open the circuit automatically on a predetermined over-current without damage to itself when properly applied within its rating. The circuit breaker is a mechanical open-closing device, witch is used for closing, breaking, separating circuit and carrying current of that circuit under ordinary conditions and for automatically breaking the circuit under extraordinary conditions like short circuit and over current.
The most important function of the circuit breaker, in addition to opening and closing the circuit, is to protect the circuit under abnormal power picks.
Features:

- In conformity with IEC 60947-2, EN 60947-2
- Wide range from 16 - 2500 A
- Compact dimensions

Figure 2

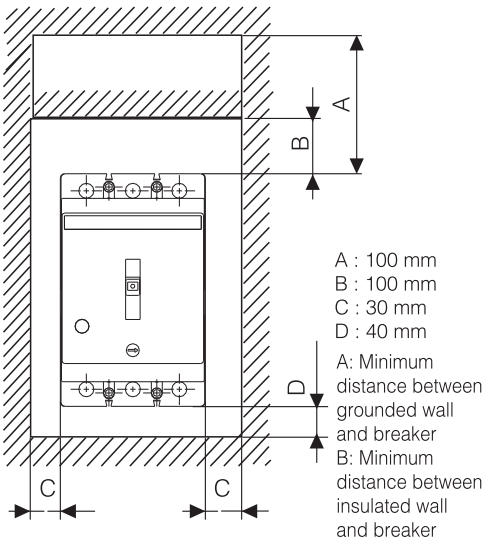

Figure 3

Utilization Type of the Circuit Breaker:
There are 3 positions indicating position of the breaker. These positions are shown in Figure-1.

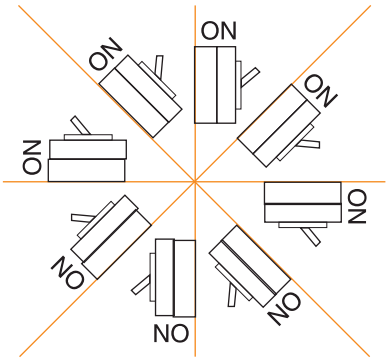
ONII Position:
It indicates that contacts of the breaker are closed. In this position, the breaker lever is in the top position.

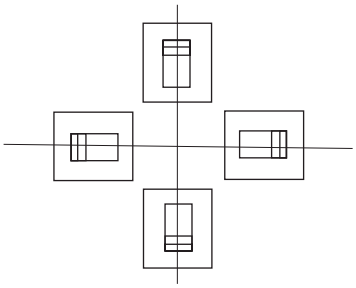
TRIP Position:
It indicates that the breaker is opened due to any failure (overload or short circuit). In this case, breaker lever is in the middle position between ON and OFF positions. In order to take the breaker, which is in trip position, to ON position; push the breaker lever downwards as shown by the OFF sign. Breaker shall be set with “click” sound. After that, pull the lever as shown by ON sign to close the breaker.

OFF/0 Position:
It indicates that contacts of the breaker are open. In this way, the breaker lever is in the bottom position.

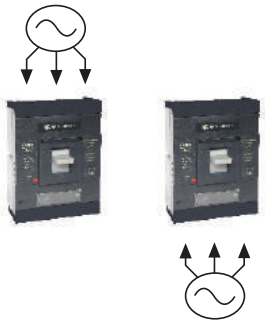
Assembly:
Important considerations during assembly are listed below.
- The place to assemble the breaker should be free of dust and moisture.
-Breaker should be assembled in a way not to be subject to gas and vapour.
- If the environment is dusty and moist, the breaker must be assembled in a housing with appropriate protection degree.
- While the breaker is in operation, it should not be exposed to vibration and sudden impacts.
- Minimum distances between two breakers assembled one on another should be as shown in Figure-2.
- Minimum distances between grounded or insulated wall and the breaker should be as shown in Figure-3.
- Assembly method of the connectors (for KP-250-F) vary according to connection at the front or at the back. Connector may be de-mounted, reversed and mounted again if required.
- Cable connections of measurement devices should be made through busbar, no connection should be made through terminals of the breaker (Please request extension busbar from factor for connections to be made with cable shoes.)
- End insert should be used in connections of multi-wire cables to breaker connector and no brazing should be made at cable ends.
- If connection is made to the breaker via copper busbars, busbars should be painted and feather edges should be rounded to minimize the risk of jumping.
- Phase curtains must be placed in the conduit between two busbars in the breaker body.
- Grounding should be made in accordance with the regulations.

Assembly





Assembly can be made in any angle.



Line can be connected to Rade Koncar circuit breakers from above and from below, however connection from above should be preferred.

Temperature Compensation:
Current load capacity of device decrease if the operating temperature is exceed to given value on indoor conditions Standard Circuit breakers was calibrated for 40 °C. Values in the chart show the highest operating currents to be applied as a function of the ambient temperature. Increase in ambient temperature of the breaker shall result in decrease in allowed operating current of the breaker. Therefore, by considering the ambient temperature of the breaker, the rated current should be calibrated according to ambient temperature or the circuit breaker should be selected according to operating currents suitable for the value in the table. If the breaker is operated in an environment with a temperature higher than the calibrated ambient temperature, it opens earlier than the nominal values. If it is operated in a colder environment, it opens later than the nominal values.

In(A)	20° C	30°C	40°C	50° C	60°C
Thermal-Magnetic Circuit Breakers					
16	17,1	16,6	16,0	15,2	14,6
20	21,4	20,8	20,0	19,0	18,2

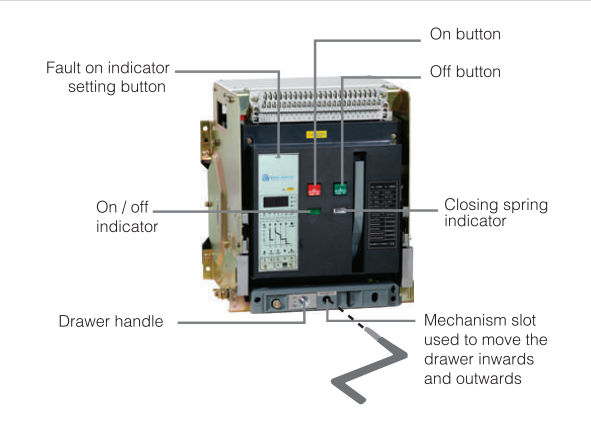
AIR TYPE CIRCUIT BREAKERS - VP

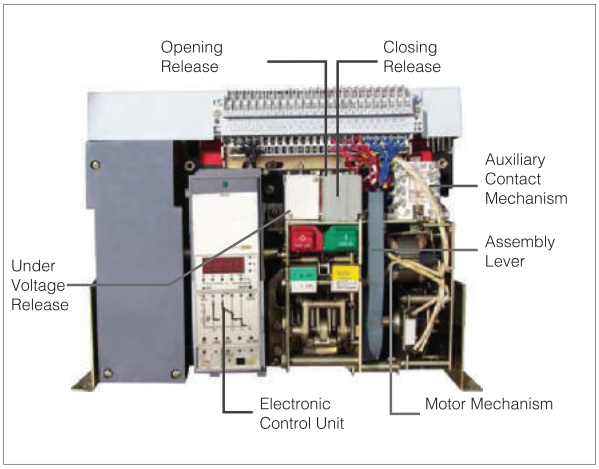
Air type circuit breakers

Air type circuit breakers - VP

AIR TYPE CIRCUIT BREAKERS - VP

Air type circuit breakers are used for protection of generators with large powers, motor, capacitor groups and transformers, as well as general protection of factories, shopping malls, business centers and else.





Air type circuit breakers are used for protection of generators with large powers, motor, capacitor groups and transformers, as well as general protection of factories, shopping malls, business centers.

Drawout Type Circuit Breaker:
Circuit breakers are automatically turned on during pull and push of the drawer via lever. When drawer-type switches fail, they can be quickly replaced with the spare one.

Features of Control Circuit

Protection Functions:
Various functions such as overload, long reverse time delayed, short reverse time delayed, short time delayed, fixed time curves are available for users demanding various protection features.

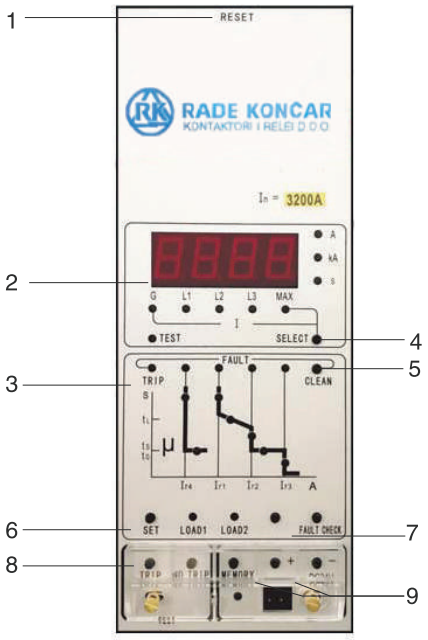
Indicator Function:
There is current adjustment indicator and operating current indicator.

Ammeter Function:
It shows the current passing through the circuit.

Alarm Feature:
It shows overload status.

Self-Control Feature:
It separates itself from the system with protection and control units against overheating.

Test Feature:
It is used to test features of the breaker.



Functions of buttons:

1- RESET: Press reset button after breaker trips, the breaker will get ready to close again.

2- CURRENT-TIME indicator: It shows the current and opening time.

3- LED: It shows status and features of the breaker.

4- SELECT: It shows maximum phase current under normal conditions. Current of each phase is displayed when you press this button.

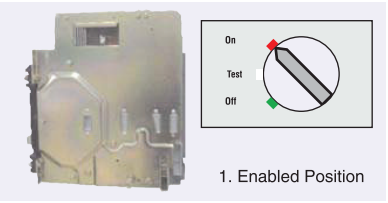
5- CLEAN: Reset button must be pressed to close the breaker after adjusting operating current or opening breaker fault current.

6- SET: You may press this button to adjust and check current and time characteristics and each status may be displayed in order.

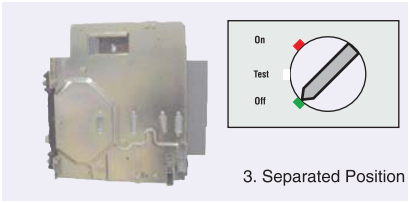
7- FAULT CHECK: When you press this button, the last fault status, faulty current and time is displayed.

8- TRIP and NON-TRIP: Only for test.

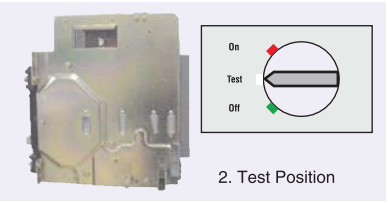
9- MEMORY: Features adjusted with (+) and (-) buttons are saved.



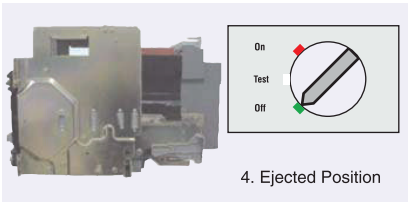
1. Enabled Position



3. Separated Position



2. Test Position



4. Ejected Position

Air type circuit breaker may be in four positions on the drawer:

1. Enabled Position: All the power circuits and auxiliary contacts are enabled.

2. Test Position: Power circuits are separated, but auxiliary contacts are enabled. This is the position of testing.

3. Separated Position: All the power circuits and auxiliary contacts are separated.

4. Ejected Position: All the power circuits and auxiliary contacts are separated. This is the position of ejecting the breaker from its drawer.

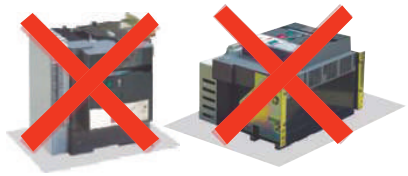
Protection Features of Over Current Breaker:
Adjustment values of the breaker are given in the table below.

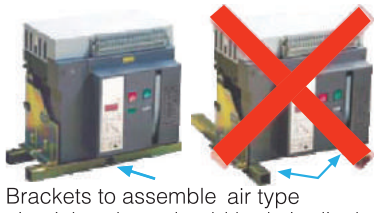
Long delay		Short delay		Instantaneous		Ground fault	
I_{r1} (0.4-1)xIn	Accuracy ±10%	I_{r2} (0,4-15)x I_n	Accuracy ±10%	I_{r3} 1.0xIn-50kA	Accuracy ±15%	I_{r4} (0.2-0.8)xIn	Accuracy ±10%

Opening Time Features:
Over current protection, long time delay, reverse time opening features are given in the table below.

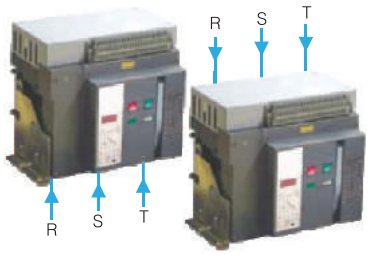
1,05xI_L	1,3xI_L	1.5xI_L time setting	(s)	15	30	60	120	240	480
>2h non tripping	<1h tripping	2.0xI_L action time	(s)	8.4	16.9	33.7	67.5	135	270

Assembly of air type circuit breakers should be made in vertical position only.





Brackets to assemble air type circuit breakers should be latitudinal as shown in the figure.



Energy connection of air type circuit breakers can be made at both bottom and top connection terminals.

Short time delay over current protection, opening features:
Reverse time (in short time delay current) protection feature of the breaker.
$I^2t = (8xI_{r1})^2xts$,
T: Opening time of the breaker
I: Fault current (Opening current)
ts: Adjusted short delay time
Ir1: If the adjusted long delay opening current is higher than over current 8 Ir1, the opening time (ts) shall automatically turn into the adjustmed delay time.

Ammeter Feature:
The ammeter shows the main circuit current on display screen. When SELECT button is pressed, it shows current of the phase with LED on or maximum phase current. When the button is pressed again, current of the other phase is shown.

Test Feature:
The breaker test be performed by pressing the test button. There are two kind of test buttons. One of them is non-trip test button and the other is trip test button. Non-trip test is performed when the breaker is connected to the network. Test is automatically broken when there is over current on the network.

Adjustment Feature:
Current and delay times are adjusted by pressing "+/-" buttons according to user needs. When you see the required current or delay time on the display, save it by pressing Storage button. When over current is present, this function is broken automatically.

Load-Dependent Features:
Two values can be set:
Load 1 current (Ic1) adjustment range (0,2-1)xIn and Load 2 current (Ic2) adjustment range (0,2-1)xIn, Ic1 time delay is adjusted to half of long time delay.
Ic2 time delay has two features; first one is reverse time delay adjusted to _ of long time delay and second one is fixed time delay set to 60 sec. Ic1 and Ic2 current values are used for disabling and enabling insignificant loads.

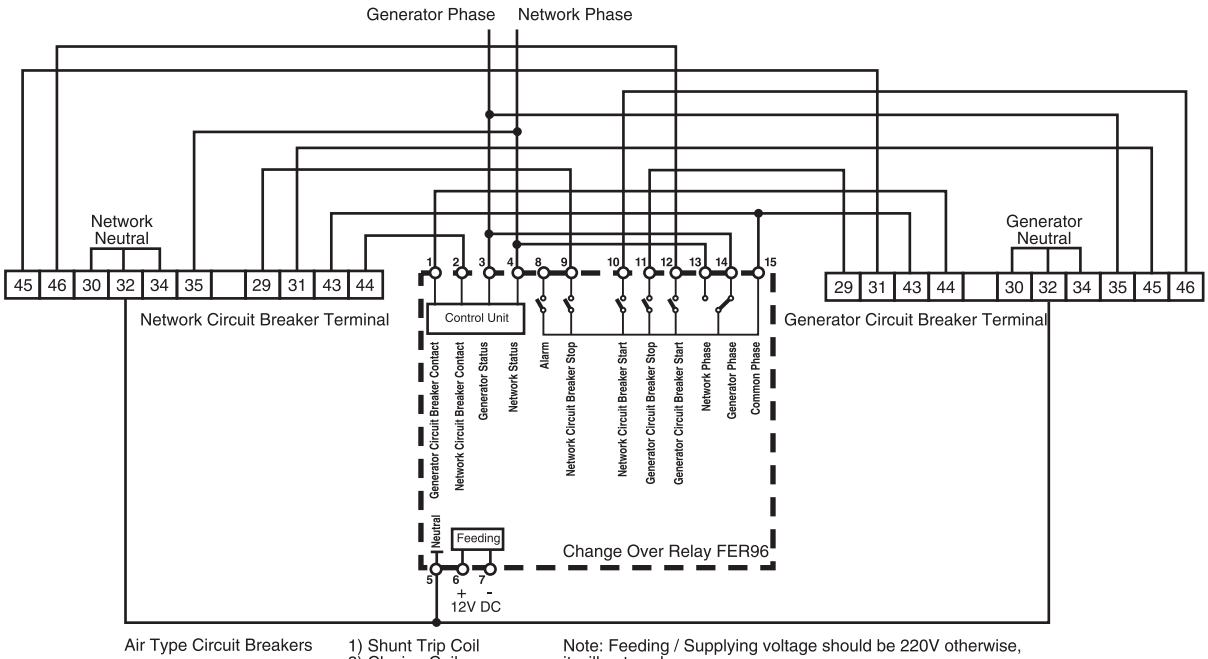
Wiring Diagram Of Change Over Systems For Air Circuit Breakers



MINIATURE & RESIDUAL CIRCUIT BREAKERS

Miniature and residual circuit breakers

Miniature and residual circuit breakers - IZP and DZP

MINIATURE CIRCUIT BREAKERS

Miniature circuit breakers are mechanical switching devices able to switch on, conduct and switch off the current under standard conditions and are able to switch on, conduct and switch off the current under abnormal circuit conditions such as short-circuit. They are used to protect house and similar installations against over currents. They are also designed to be safe when operating by untrained person, and they are maintenance free. Tripping characteristics B and C.

RESIDUAL CIRCUIT BREAKERS

- Protection in case of indirect contact
- Protection in case of direct contact
- Suitable for protection of electrical circuits in residential buildings
- Conformity with IEC 61008-1 and EN 61008-1

Miniature circuit breakers IZP 06 range 6 - 63A; B Characteristics

Accessories

Shunt trip - RKVC

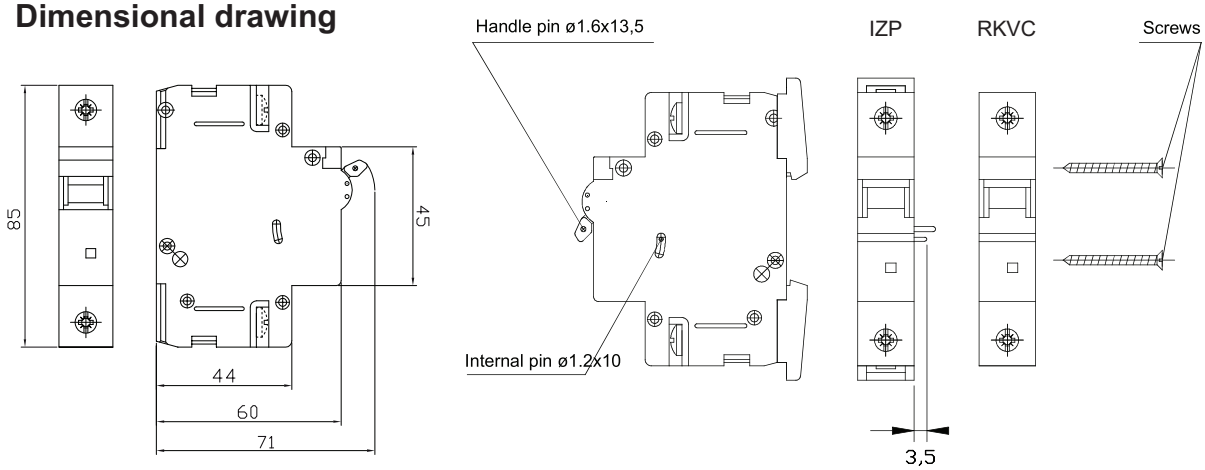
Features

- Accessories to the circuit-breaker, modular switches and residual current devices
- Utilized for the tripping of circuit-breaker (modular switch) by means of outer source of voltage in instantaneous trip-ping of the circuit
- It is delivered asseparate unit or assembled together with circuit-breaker (modular switch)
- It is mounted on right hand side of the circuit-breaker (switch), left side of residual current devices

RKVC Technical data

Standards		EN60947-1 (IEC60947-1)
Rated voltage	V	AC: 400, 230,110, 60, 48, 24,12 DC: 110, 48, 24
Rated insulation voltage	V	400
Max.switching of current (voltage of RKVC)	A(V)	AC: 0,5(400); 0,6(230; 0,5(110); 0,9(60); 0,8(48); 2,8(24; 6(12) DC: 0,6(110); 2(48); 3(24)
Rated impulse withstand voltage	kV	4
Rated making over voltage	kV	4
Range of activity voltage	%	70-110
Tripping time	ms	max. 50
Rated frequency	Hz	50
Mounting		on right side of circuit breaker (switch), left side of residual current device
Degree of protection		IP 20
Terminal capacity	mm^2	1-6 Cu

Dimensional drawing



Instructions guide for the mounting of a shunt trip RKVC

- on right side of all executions and modular switches
- circuit breaker and shunt trip have to be in switch-of position
- insert pin Ø1,6mm into aperture of operating lever and into aperture of switching system Ø1,2mm (pins are part of delivery)
- approach shunt trip to the circuit breaker in order to achieve engagement of pins into appropriate parts of circuit breaker and switching system of RKVC
- into free holes in shunt trip RKVC enter stainless steel screws and slightly tight the screws to attach it to the IZP
- check the function of RKVC with IZP by switching on the MCB and pushing the mechanism through the hole for pin Ø1.2mm with appropriate tool.

Operational voltage	Type
24 V ~	RKVC 24 V ~
48 V ~	RKVC 48 V ~
110 V ~	RKVC 110 V ~
230 V ~	RKVC 230 V ~
400 V ~	RKVC 400 V ~
24V=	RKVC 24V=
48V=	RKVC 48V=
110V=	RKVC 110V=

Accessories

Under voltage trip - RKPC

Features

- Accessories to IZP
- They are using to protection against rerun - up of motor by failure in mains
- Signalisation of release position green / red
- Auxiliary button for correct function control
- Mounting to circuit breakers in factory(*)

IZP+RKPC

Accessories

Auxiliary contacts PKJ, 2PKJ, PSKJ

Features

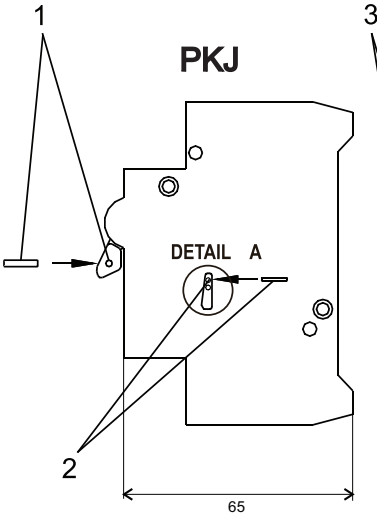
- These are accessories to circuit - breakers and residual current devices
- Can be obtained as separate units or mounted together with circuit - breaker (modular switch)
- They are mounted on the left hand side of the circuit - breaker (modular switch) by means of pins and screws

PKJ 2PKJ PSKJ

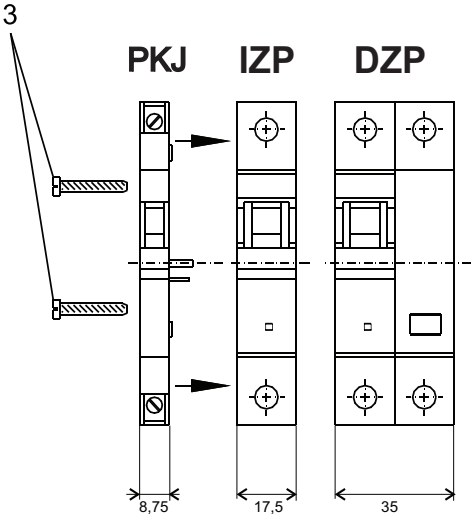
Technical data

Standards		EN60947-5-1 (IEC60947-5-1)
Rated insulation voltage U_i	V	400
Rated operational voltage U_e	V	230
Rated thermal current I_{th}	A	16
Rated operational current I_e	A	4 (AC15 at U_e = 230V) 0,5 (DC13 at U_e =110V)
Conditional short circuit current with fuse 16A I_k	A	800
Max. conventional back-up fuses	A	16 gL
Rated frequency	Hz	50-60
Mounting		on left side of device
Degree of protection		IP 20
Terminal capacity	mm^2	0,5-2,5 Cu

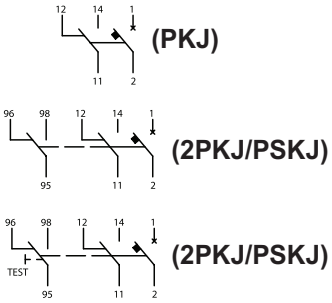
INSERT PINS



CONNECT WITH 2 SCREWS



Contacts scheme



1.Pin of handle Ø1,6mm
2.Pin Ø1,2mm, l=10mm
3. Screws

1. In the block of auxiliary insert into handle the pin of ø1,6 mm and into the opening of the switching system the pin ø1,2 mm.
2. Approach contacts block to IZP/DZP to let the pins snap in to relevant device pieces. During the assembly must be both handles the IZP/DZP and the contact block handle OFF.
3. Insert in to free openings in the contact block the tapping screw and attach freely to IZP/DZP.
4. Verify mechanical function of auxiliary contact with IZP/DZP by pushing through the device opening ø1,2 mm with appropriate device the mechanical part (pin, needle etc.)

Accessories

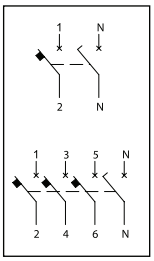
N-POLE

Features

- Assembling with circuit breaker at manufacturer's site according to the requirement of the customer
- Neutral pole can be assembled to all AC circuit breakers (current ratings, tripping characteristics)
- Neutral pole is without release, on making of circuit breaker it makes before the other contacts and during breaking it breakes after the other poles
- On ordering of neutral pole please state type and ordering number of the circuit breaker and type and ordering number of the neutral pole

N-POLE

Scheme



Type
N-pole of circuit breaker IZP 0,2 - 25 A

Accessories

TERMINAL COVERS

Features

- Accessories to the circuit-breaker and modular switches
- Used for the improving of degree of protection to value IP30 and together with sealing blind also for sealing of terminals
- Single pole cover of terminals do not increase width of module of circuit breaker (modular switch); for the protection of both terminals two covers are needed
- Three pole cover of terminals is applicable only for IZP; the width of three pole module will change from 52,5 to 57 mm.
- For the fixing of cover to circuit-breaker (modular switch) there is necessary sealing blind PZ

Dimensional drawing

ELECTRONIC TIME RELAYS

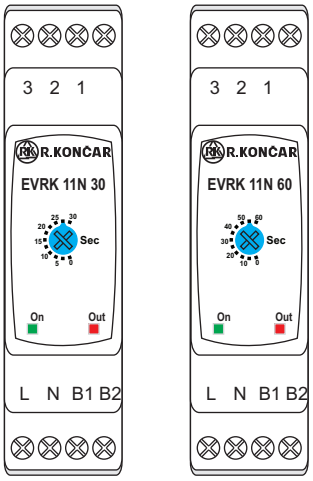
Electronic time releys

Electronic time relays - EVRK and EVRU

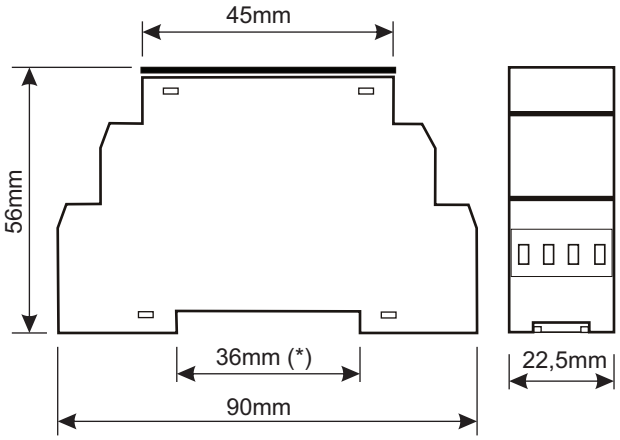
ELECTRONIC TIME RELAYS

Time relays are electronic relays which can switch on or off connected loads after the predefined time has elapsed. Our time relays are available in various designs

Timer EVRK 11N 30 and 60



Dimensions



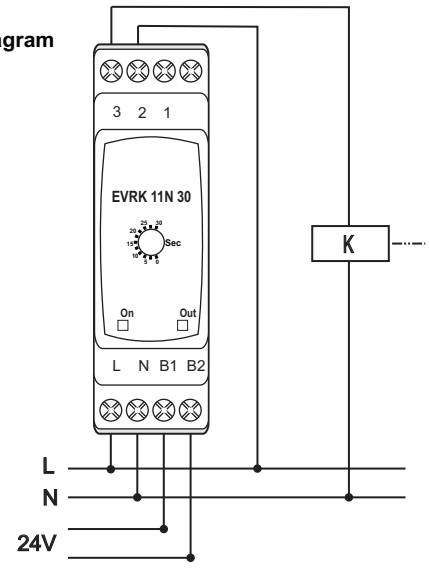
General Specifications

EVRK 11N are the delay on timers. When the application of voltage to the timer's supply inputs, the counter starts counting (1 - 2 contacts are short cut). End of the adjusted time, counter stops counting and the output becomes on (2 -3 contacts are short cut). When the supply voltage cut off, the timer reset.

Supply Voltage : 220 Vac ± %20 (L,N), 50 / 60 Hz
B1,B2(Vac) : 24 ☑ ; 12☐
B1,B2(Vdc) : B1:+ ; B2: -

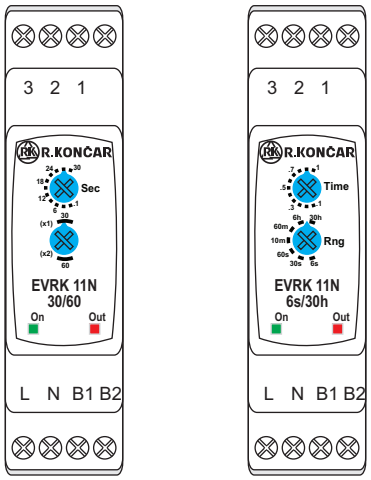
Electrical Connector : PCB Connectors (2,5 mm2)
Power Consumption : < 7 VA
Ambient Temperature : -5 ºC...+55
Control Output : Relay, 1 Changeover, 10A / 250 Vac
Electrical Life : 100.000 ops. (Ressistive Load)
Connection : DIN 35 rail or Vertical Installation (Installation springs behind the box should be pushed outward to enable screwing).

Shematic diagram



Type EVRK 11N					
Type	Order number	Time interval	Electrical connection	Weight [g]	Packing [pcs]
EVRK 11N 30	604538	0.3...30 sec	PCB Clamp	90	1
EVRK 11N 60	604539	0.6...60sec	PCB Clamp	90	

Multi range timers EVRK 11N 30/60 and 6s/30h



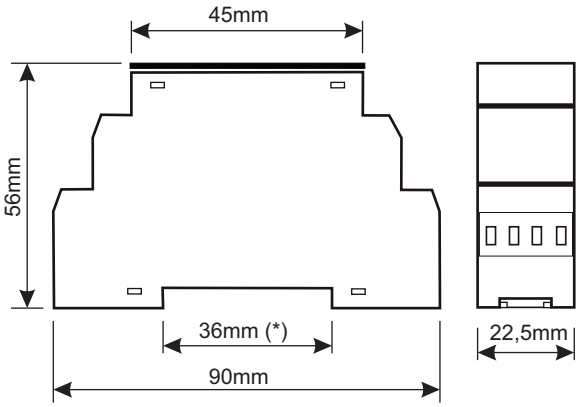
General Specification:

EVRK 11N 30/60 and 6s/30h multi range timer are delay on timers. When the supply is ON timers "ON" led is lighted and waits till adjusted period of time (meanwhile relay contacts 1-2 is short-cut). After adjusted period of time "Relay" led is ON and relay suppies to the system (meanwhile realy contacts 2-3 is short-cut). When the supply is cut than timer returns to the first position.

EVRK 11N 30/60 timer is adjusted 30 sec. or 60 sec. with the adjustment pot on the front panel. Upper adjustment pot sale shows for 30 second. For the 60 second applications scale is multiplied by 2.

EVRK 11N 6s/30h multirange timer has 7 time range. Upper adjustment pot has multplier of 10 pieces. Maximum value is 1. Time value is the value that is adjusted in "time range".
Both relays does not accept any user interuptions while process has already begun.

Dimensions



Supply Voltage : 220 Vac ± %20 (L,N), 50 / 60 Hz
B1,B2(Vac) : 24 ✓ ; 12
B1,B2(Vdc) : B1: - ; B2: +
B,N(Vac) : 24 ✓ ; 12
B,N(Vdc) : B:+ ; N: -
Power Consumption : < 7 VA
Ambient Temperature : -5 ºC...+55 °C
Control Output : Relay,1 Change Over, 10A / 250 Vac
Electrical Life : 100.000 ON / OFF (Resistive)
Montage Type : By closing back side montage spring, it can be montaged to the DIN 35 rail. For plain surfaces, montage is done by montage spring in outward position.

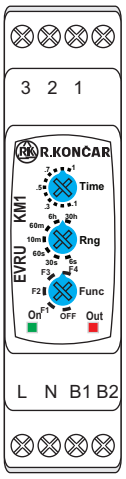
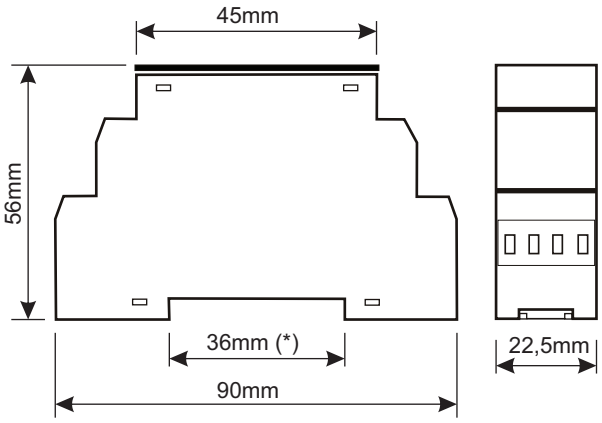
Multi function timers EVRU KM1



Dimensions



General Specification:

EVRU KM1:
Multi functional Timer is micro controller based and has 4 functions. Working functions, time ranges and time adjustments can be done at front of the timer.

A) Time Adjustment: This is a multiplier which multiplies the time range according to the adjusted function. Multiplier is between 0,01 to 1. With this button you can divide time ranges till 100 times.

B) Time Range Adjustment: This for choosing the time ranges. Time adjustment are between 6 seconds till 30 hours.

C) Function Adjustment: This is for choosing appropriate function to your need. Relay has 5 steps, four of them is for functions and one of them is to CUT relay output in every condition.

OFF: It cuts relay output in every condition. S`pecially good for checking the system.

F1: Delay ON Function: When relay is energised, ON led is lights, after adjusted time OUT led is light.

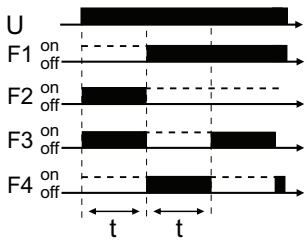
F2: Delay OFF Function: When relay is energised, ON led OUT led islight on, after adjusted time OUT led is off.

F3: Equal Time ON Flasher Function: When relay is energised, ON led and OUT led is on, after adjused time OUT led is off, than again after same adjusted time OUT led id on, and this continues in cycle.

F4: Equal Time off Flasher Function: When relay is energised, ON led is on and OUT led is off, after adjused time OUT led is on, than after again same adjusted time OUT led is off, and this continues in cycle.

Note: "On" and "Off" time ranges are equal for F3 and F4 functions

Function Schemes



Relay Contacts: 

t: Adjusted Time

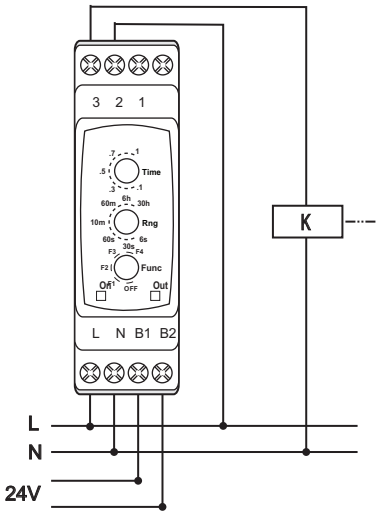
U: Supply Voltage

Time Range		
Step	**Min. Multiplier =0,01**	**Max. Multiplier =1**
6 s	**0,06 s**	**6 s**
30 s	**0,3 s**	**30 s**
60 s	**0,6 s**	**60 s**
10 m	**0,1 m**	**10 m**
60 m	**0,6 m**	**60 m**
6 h	**0,06 h**	**6 h**
30 h	**0,3 h**	**30 h**

Technical Specifications:

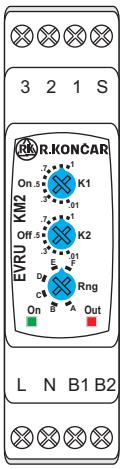
Supply Voltage	: 220 Vac ± %20, (L , N)
B1,B2(Vac)	: 24 ☑ ; 12 ☐
B1,B2(Vdc)	: B1:+ ; B2:-
Adjustment Accuracy	: ± %3
Time Range	: 0,06 sec...30 hour
Functions	: F1: Delay ON F2: Delay OFF F3: Equal ON/OFF ON start Flasher F4: Equal ON/OFF OFF start Flasher
Power Consumption	: <= 3 W
Ambiant Temperature	: -5...+55 °C
Contacts Type	: 10A, 250 Vac(Omron)
Electrical Connections	: PCB Connectors (2,5 mm2)

Shematic diagram

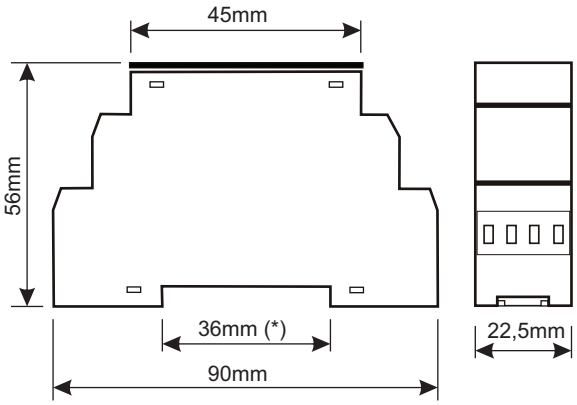


Type EVRU KM1					
Type	Order number	Time interval	Electrical connection	Weight [g]	Packing [pcs]
EVRU KM1	604536	0.6s...30h	PCB Connectors	90	1

Multi function timers EVRU KM2



Dimensions



General Specification:

It is based microprocessor and 6 ranges for asymmetrical flicker, Ranges can be adjusted from front panel.

1) On Time (k1) : On time multiplier can be adjustable between 0.01 to 1

2) Off Time (k2) : Off time multiplier can be adjustable between 0.01 to 1

3) Range : Gives the range of asymmetrical work

When A1-A2 is energised "pwr" led and "OUT" led is on. Relay is on (2-3 contacts short cut) till the adjusment time "ON" time relay remains on then "OUT" led is off and relay is off (1-2 contacts are short cut) and remains till the adjusted "OFF" time and "OUT" led is on. This continues in cycle.

	Max. Times	Time Adjustment	
(Range)	ON_{max} / OFF_{max}	ON	OFF
A	60 sec/60 sec	k1 x 60 sec	k2 x 60 sec
B	10 m /60 sec	k1 x 10 m	k2 x 60 sec
C	60 m /60 sec	k1 x 60 m	k2 x 60 sec
D	10 m /10 m	k1 x 10 m	k2 x 10 m
E	60 m /60 m	k1 x 60 m	k2 x 60 m
F	10 h /10 h	k1 x 10 h	k2 x 10 h

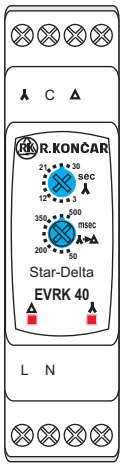
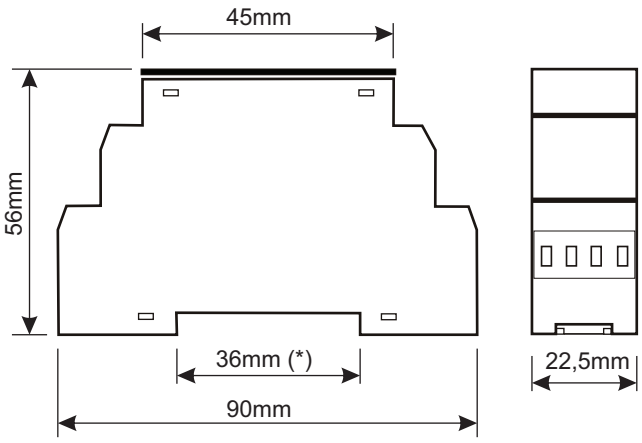
Star-delta timer EVRK 40



Dimensions



General Specification:

When supply is connected to L and N "⅄" led is on and "C" is close contact with "⅄". Device remains this position till "t(⅄)" . After "t(⅄)" is passed "C" is open contact during "t(⅄→Δ)" time period. After "t(⅄→Δ)"is passed "C" is connected to the "Δ" and "Δ" led is on. Device remains this position till supply is disconnected.

1- "t(⅄)" Time Adjusment: it adjust star working time that is between3sec to 30sec.

2- "t(⅄→Δ) Time Adjusment: it adjust star-delta transfer time that is between 50msec to 500,sec.

Technical Specifications

Supply Voltage	**:** 220 Vac ± %20, 50/60 Hz (L - N)
Star Working Time	: 3sec...30sec
Star-Delta Transfer Time	: 50msec...500msec
Power Consumption	**:** < 7VA
Ambient Temprature	**:** -5...+55 °C
Contact Type	**:** 2 NO, Relay,10A / 250 Vac(Omron)
Electrical Connector	: PCB Connectors (2,5 mm2)
Connection	**:** Vertical inside panel or DIN 35 rail
Weight	: 0,09 kg

AUTOMATIC POWER FACTOR CORRECTION UNITS AND COMPONENTS

Automatic power factor correction units

Automatic power factor correction units

Solutions for compensation of reactive power

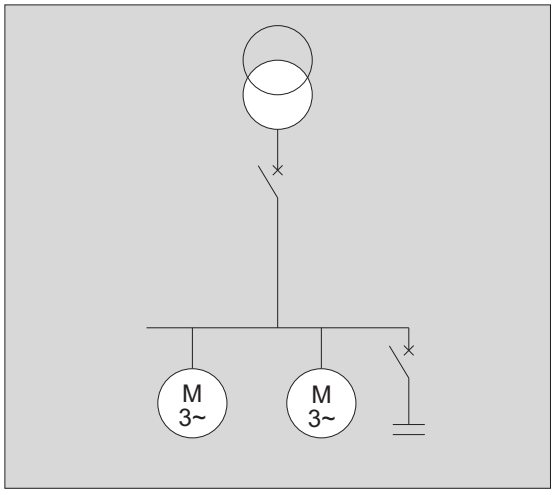
Automatic Power factor correction unit is fully automatic in operation and can achieve desired power factor under fluctuating load conditions

Components
- Capacitor banks
- Contactors for capacitor switching
- Power factor controllers
- Detuned filter reactors

SYSTEMS AND TYPES OF COMPENSATION

When selecting capacitor bank, there are two compensation systems.

Fixed type capacitor banks

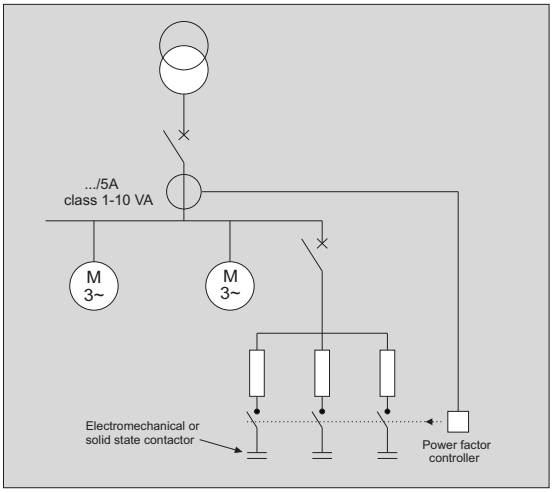


- The reactive power supplied by the capacitor bank is constant irrespective of any variations in the power factor and the load of the receivers, thus of the reactive energy consumption of the installation.

- These capacitor banks are switched on:
- Either manually by a circuit breaker or switch
- Or semi-automatically by a remote-controlled contactor

This type of capacitor bank is generally used in the following situations:
- Electrical installations with constant load operating 24 hours a dey
- Reactive compensation of transformers
- Individual compensation of motors
- Installation of a capacitor bank whose power is less than or equal to 15% of the power of the transformer

Automatic type capacitor banks



- The reactive power supplied by the capacitor bank can be adjusted according to variations in the power factor and the load of the receivers, thus of the reactive energy consumption of the installation.

- These capacitor banks are made up of a combination of capacitor steps (step = capacitor + contactor) connected in parallel. Switching on and off of all or part of the capacitor bank is controlled by an integrated power factor controller.

- These capacitor banks are also used in the following situations:
- Variable load electrical installations
- Compensation of main LV distribution boards or major outgoing lines.
- Installation of a capacitor bank whose power is more than 15% greater than the power of the transformer

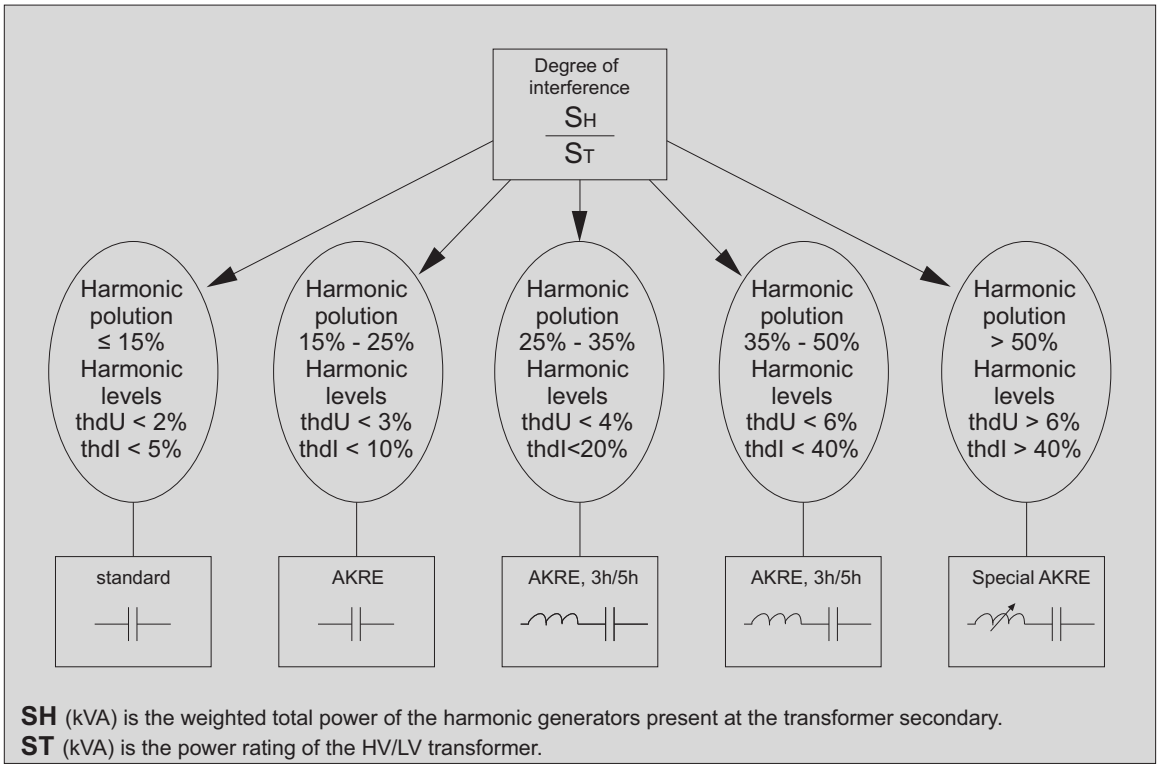
PROTECTING CAPACITORS FROM HARMONICS

By design and in accordance with current standards, capacitors are capable of continuously withstanding an rms current equal to **1.3 times the nominal current** defined at the nominal voltage and frequency values.

This overcurrent coefficient has been determined to take account of the combined effects of the presence of harmonics and overvoltages (the capacitance variation parameter being negligible).

It can be seen that depending on the degree of harmonic pollution SH (power of the harmonic generators), this coefficient is generally insufficient and that the parameter Ssc (short-circuit power), directly related to the power of the source ST, is preponerant in the value of the parallel resonance frequency (Fr.p).

By combining these two parameters, SH and ST, three types of mains supply can be defined, with a corresponding “type” of capacitor to be installed:



SH (kVA) is the weighted total power of the harmonic generators present at the transformer secondary.
ST (kVA) is the power rating of the HV/LV transformer.

TECHNICAL DATA:

AKRE capacitor banks are automatic banks with switching via electromechanical contactors.
- Rated Voltage: 400V, 50Hz; 3;
- Admissible working voltage range for the capacitors:
  AKRE: 380 - 440V
  AKRE 5h: 380 - 440V
  AKRE 3h: 380 - 525V
- Regulation Voltage: 230V, 50Hz
- Temperature class:
  Operation -10/+45°C (average over 24 hours: 40°C)
  Operation -10/+40°C (average over 24 hours: 40°C)
  Storage -30/+60°C
- Ventilation: natural or forced
- Colour grey cabinet (RAL 7035), black base
- Tolerance: 1,1 x Un & 1,3-1,5 x Ie
- Mechanical protection: IP 31
- Standards: EN 60439-1; IEC 60439-1 and 2

CONSTRUCTION OF THE ELECTRICAL CABINETS

The electrical cabinets have a metal case, they are prepared for a standing mounting position with a low voltage switches MCCB built-in as a standard mode.
W - wide , H - height, D - depth

Other powers, voltages, frequencies on request.
Fix capacitor banks on request.

PAKRE capacitor banks are Semi - automatic banks with switching via electromechanical contactors.
- Rated Voltage: 400V, 50Hz; 3;
- Admissible working voltage range for the capacitors:
  AKRE: 380 - 440V
- Regulation Voltage: 230V, 50Hz
- Temperature class:
  Operation -10/+45°C (average over 24 hours: 40°C)
  Storage -30/+60°C
- Ventilation: natural or forced
- Colour grey cabinet (RAL 7035), black base
- Tolerance: 1,1 x Un & 1,3 x Ie
- Mechanical protection: IP 31
- Standards: EN 60439-1; IEC 60439-1 and 2

Fixed capacitor banks

AKRE capacitor banks with built-in circuit breaker
Assembly filled and wired in an IP 31
- Rated Voltage: 400V, 50Hz; 3;
- Admissible working voltage range for the capacitors:
  380 - 440V
- Regulation Voltage: 230V, 50Hz
- Temperature class:
  Operation -10/+45°C (average over 24 hours: 40°C)
  Storage -30/+60°C
- Ventilation: natural
- Colour grey cabinet (RAL 7035),
- Tolerance: 1,1 x Un & 1,3-1,5 x Ie
- Mechanical protection: IP 31
- Standards: EN 60439-1; IEC 60439-1 and 2

Cylindrical capacitor standard duty

Construction

- Dielectric: Polypropylene film
- Non PCB, Soft Polyurethane resin
- Extruded round aluminium can with stud
- Provided with discharge resistors
- Overpressure disconnector

Features

- Three phase, delta connected
- Self-healing technology
- Naturally air cooled (or forced air cooling)
- Indoor mounting

Typical applications

- For Power Factor correction

Terminals

- 6.3mm fast-on terminals for plastic top -2,5 to 5 kvar
- Screw terminal for metal top – 7.5 to 30 kvar

Mounting parts

Threaded stud at bottom of can
(max. torque = 4Nm for M8 & 10Nm for M12)

II - Types with Metal top

Discharging
Capacitors must be discharged to a maximum of 10% of rated voltage before they are switched on again. This prevents an electric impulse discharge in the application, influences the capacitor's service life and protects against electric shock. The capacitor must be discharged to 50 V or less within 60 seconds. There must be not any switch, fuse or any other disconnecting device in the circuit between the power capacitor and the discharging device. Discharge and short circuit capacitor before handling!

Service life expectancy
Electrical components do not have an unlimited service life expectancy; this applies to self-healing capacitors too. The maximum service life expectancy may vary depending on the application the capacitor is used in.

Thermal load/over-temperature
After installation of the capacitor it is necessary to verify that maximum hot-spot temperature is not exceeded at extreme service conditions.

Overpressure Disconnector
To ensure full functionality of an overpressure disconnector, the following must be observed:
1. Maximum allowed fault current of 10000 A in accordance with UL 810 standard must be assured by the application.
2. Stress parameters of the capacitor must be within the IEC60831/IS13340 specification.

Over current and short circuit protection
- Use HRC fuses or MCCB-s for short circuit protection. Short circuit protection and connecting cables should be selected so that 1.5 times the rated capacitor current can be permanently handled.
- HRC fuses do not protect a capacitor against overload - they are only for short circuit protection.
- The HRC fuse rating should be 1.6 to 1.8 times rated capacitor current.
- Do not use HRC fuses to switch capacitors (risk of arcing).
- Use thermal magnetic over current relays for overload protection.

Resonance cases
Resonance cases must be avoided by appropriate application design in any case. Maximum total RMS capacitor current (incl. fundamental harmonic current) specified in technical data must not be exceeded.

Re-switching vs. phase-opposition
In case of voltage interruption, a sufficient discharge time has to be ensured to avoid phase-opposition and resulting high inrush currents.

Cylindrical capacitor standard duty

Vibration resistance
The resistance to vibration of capacitors corresponds to IEC 68, part 2–6.

Max. test conditions:	
Test duration	6 h*
Frequency range 1	10 ... 55 Hz*
Displacement amplitude	0.75 mm*

*corresponding to max. 98.1 m/s” or 10 g
These figures apply to the capacitor alone. Because the fixing and the terminals may influence the vibration properties, it is necessary to check stability when a capacitor is built in and exposed to vibration. Irrespective of this, you are advised not to locate capacitors where vibration amplitude reaches the maximum in strongly vibrating equipment.

Mechanical protection
The capacitor has to be installed in a way that mechanical damages and dents in the aluminum can are avoided.

Grounding
The threaded bottom stud of the capacitor has to be used for grounding. In case grounding is done via metal chassis that the capacitor is mounted to, the layer of varnish beneath the washer and nut should be removed. The maximum tightening torque is 10 Nm for M12 stud and 4Nm for M8 stud.

DETUNED FILTER REACTORS

Detuned Filter Reactors, are used in series with capacitors in power factor correction units - AKRE. By using these types of detuned reactors it is possible to avoid following negative effects on system.

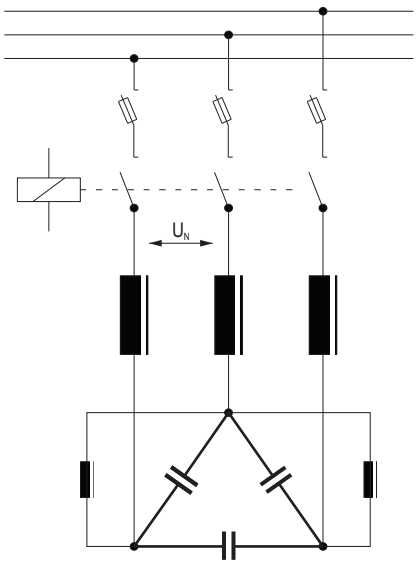
- Overcurrect during switching on the capacitor banks
- Overload of capacitors because of the harmonic resonance.
- Short lifetime on capacitors
- Overheating of the utility transmission cables.
- Overheating of the distribution transformer.
- Unintended triggering of the protective devices.
- Distortion of utility voltage waveform and problems on voltage sensitive devices
- Interferences on data transmission systems
- Unexplainable faults in electronic boards

Choosing the correct detuned filter reactor and capacitor value on detuned power factor correction systems is very important. To obtain optimum performance form a detuned power factor correction system following criteria must be controlled and met during the pairing of the reactors and capacitors.

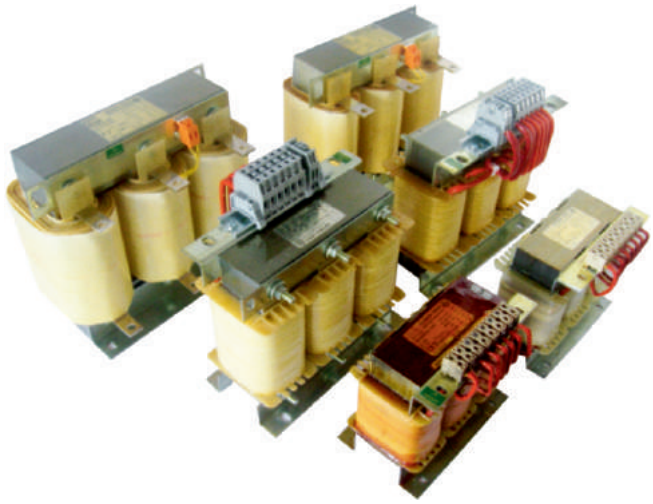
CHOOSING CORRECT DETUNED FILTER REACTOR

- The resonance frequency must be chosen according to harmonic analysis of the system
- The voltage across the terminals of the capacitor will increase because of the inductive reaction of the rector. The rated voltage of the capacitors must be chosen according to the resonance frequency.
- In detuned power factor correction systems, presence of higher voltage rated capacitors and reactors causes a difference between rated capacitor power and obtained reactive power. The obtained power must be calculated in order to avoid low compensation.
- The reactors will genereate extensive heat dur to heavy harmonic load on them. The cabinets must be designed to disperse this heat.

Installation od detuned (reactor-connected)capacitors



Defuned filter reactors are high quality reactors designed to be used in detuned power factor correction units.These reactors are compatible with european standards.



TECHNICAL SPECIFICATIONS

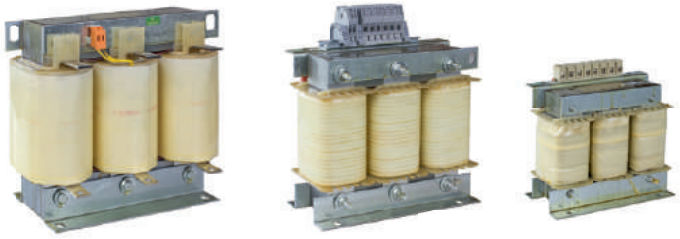
- Rated Voltages: 400V
- Rated Frequencies: 50HZ
- Mean value across three phases: ± 5%
- Linearity: I_{lin} = 1,56 - 2,2In
- Single or three phase, high permeable iron core, air gapped design
- High quality copper or aluminium windings
- Availiable at any resonance frequency
- Linearty according to resonance frequency
- Harmonic loads according to EN 6100-2-2
  U_1 = %106 x Un
  U_3 = %0,5 x Un
  U_5 = %5 x Un
  U_7 = %5 x Un
- Protection class: IP00 indoor mounting
- Cooling: natural cooling
- Thermal Switch for overload protection
- Thermal block, bar or cable connection depending on current value
- Vacuum impregnated varnish to ensure silent and moisture-immune operation
- Compatibility with EN 61558 2-20

VALUES TO BE SPECIFIED FOR CUSTOM DETUNED FILTER REACTORS

- Utility Voltage
- Resonance frequency
- Information on the availiable capacitors.

Most common mistake made at detuned filter applications is chosing inappropriate reactor and capacitor pairs. Especially the reactors stated in manufacturer cataloques are used in conjunction with a specifict capacitor value. While chosing the necessary capacitor reactor pair, the selection tables in catalogs must be controlled to ensure that proper pair is chosen, if a different brand capacitor is going to be chosen, the capacity value must be the same as the original. In a mismatchcase the resonance frequency will shift and cause severeproblems for the system.

DETUNED FILTER REACTOR SELECTION TABLE



Detuned filter reactors with:
- Resonance frequency = 134Hz.
- Blocking factor p%= 14%.

400V 50Hz Utility Voltage, 134Hz Resonance Frequency (p=14%)								
Type	Capacitor RKC 525..S	Target Power	L	Irms	Ith	Ilin	C	Weights

*Specified capacitor values are used during the reactor design. Severe problems may occur when using another capacitor in conjunction with these reactors. Custom reactor designs are possible.
*Dimensions values may change depending on design.

Reactive power controllers

The RKPFR power factor controller calculates the active and reactive power in the mains from the measured current and voltage. The intelligent control algorithm optimizes the switching sequences and guarantees for short regulation times with minimum number of switching. At the same time, switching operations are equally shared among the available capacitor branches where possible. The integrated connection control immediately detects in which phases voltage and current are measured, and adapts the entire system automatically. The very low current threshold of 10mA allows for very reliable and exact PF controller 1A as well as 5A current transformers can be used without additional manual adjustments. The power supply covers a voltage range of 90....550V.

GENERAL SPECIFICATIONS for RKPFR

RKPFR compensates the system according to total reactive power by measuring voltage and current from single phase.

- It compensates according to systemic cosϕ value. It is recommended that it is used for electro-mechanical energy meters, it must be used with three phase capacitors.
- Measures current and voltage values.
- Computes systemic cosf value.
- Operates according to first out (FIFO) principle.
- Target cosϕ value can be adjusted to be inductive or capacitive.
- Capacitor switch-on time and switch-off time can be adjusted individually.
- C/k value can be adjusted.
- It indicates Over Current and Over Voltage Alarms. Alarm outputs can be activated by user in Menu mode.
- It indicates Under Current Alarm.
- It indicates Over and Under Compensation Alarms.
- It has a fan output to cool the panel and temperature value can be adjusted. Fan can be made passive by user in Menu mode.
- Device sense current directions of phase.
- Automatic set and easy installation.

GENERAL SPECIFICATIONS for RKPFR plus

RKPFK Plus compensate by measuring 3 phase current & voltage and controls according to 3 phases individual reactive power needs. - 3 different methods can be chosen.

P1: compensate according to 3 phases average cosf value. It is suggested to use with electro-mechanical electricity meter and balanced loads.

P2: Mixed method. Compensate 3 phase according to individual reactive power need switching Three Phase & Single Phase capacitor.

P3: Compensates individually with Single phase capacitor. It can be used with electromechanical & Electronic electricity meter.

- Monitors 3 Phase Reactive Power need, Reactive Ratio, Apparent Power, Active Power, Current, Voltage at the same time.
- Intelligent working, switching ON and OFF capacitors that is needed without any program.
- Recognition of Capacitors Automatically.
- Measures Capacitors and monitors their actual values.
- Reactive power ratios of 3 phase can be monitored and adjusted individually.
- Heat of panel is measured and automatically controlled by fun output.
- 15 steps:
  P1: 15 steps 3 phase capacitors
  P2: 6 steps 3 phase capacitors and 3 step single phase capacitors for every phases.
  P3: 5 step single phase capacitors for every phase.

Standard Power Factor Controllers

Type	Maximum Steps	Supply: 1 Phase-Neatral 220-230Vac	App.: Low Voltage	Screen: LED	Measure.: 1 Phase 1 Current	Control: 3 Phase 1 Capasitor	Measurements: Voltage (V)	Measurements: Cuurent (A)	Measurements: Cosϕ	Measurements: Active Power	Measurements: Reactive Power	Measurements: Apparent Power	Accesory: Temperature (Fan Output)	Dimensions (mm): 144 x 144

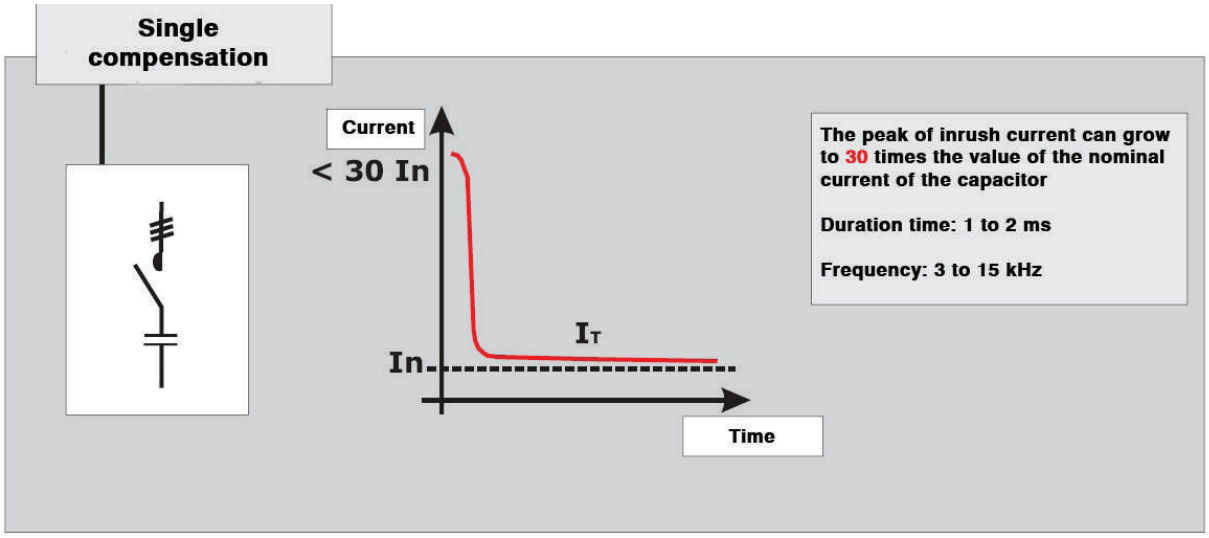
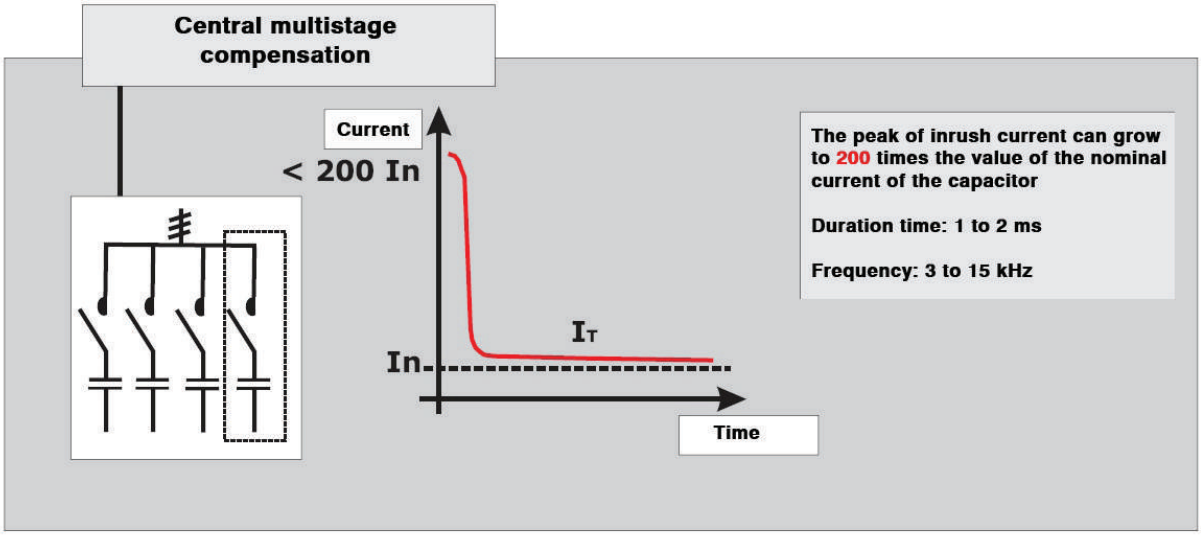
Contactors for controlling three phase capacitor banks

While switching on and switching off the capacitor banks under load, it comes to short - circuit overloads on the order of the short - circuit current. Therefore, in order to protect staff and electrical installation is necessary to be used contactors for controlling of capacitor banks. The use of standard contactors are jeopardizing personnel and complete electrical installation.

While switching on the capacitor in the AC system, it's created a resonant current circuit, which in greater or lesser extent is damping, and the already bruised capacitors cause inrush current of 200 times the nominal current.

The great value of the making current can lead to melting of the main contacts of the contactor, it is also detrimental to capacitors. The value of the making current depends on the type of compensation, which is displayed with the following schedules:





In the automatic compensation systems, contactors which throttle the making current have to be used. With throttling of the making current, the voltage drops and transit currents are also avoided.

In these capacitor contactors pre-contacts are used to limit making current. Each pre - contact is connected in series with a resistor to limit the making current (current charge) of the capacitors. Pre-contacts are closing before main contacts, and open when latest are surely closed. This is achieved with using the system of permanent magnets, not with mechanical lever. Such construction of capacitor contactors ensure effective functioning in their working lifetime. The functioning of capacitor contactor is shown in Figure 1.

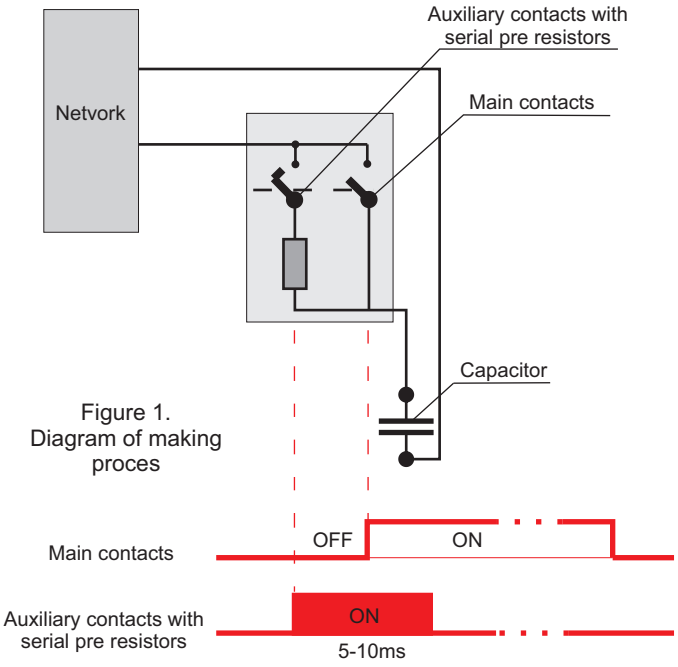


Figure 1.
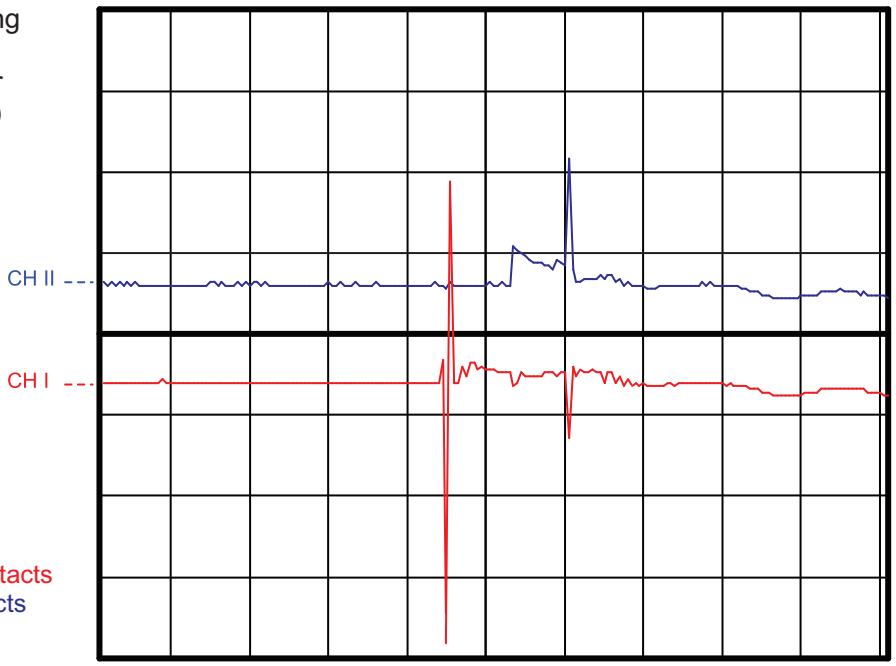
Diagram of making proces

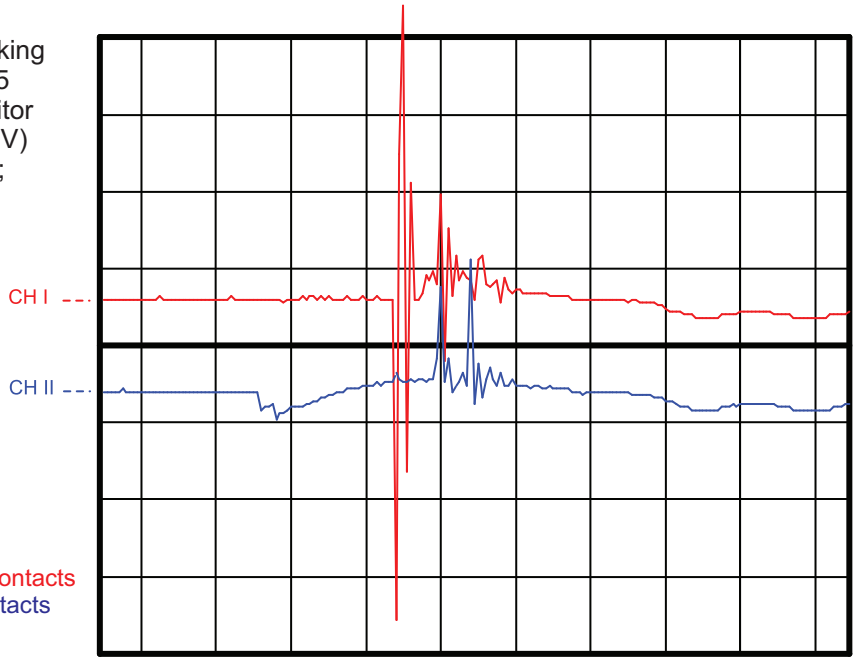
Efficient operation of the capacitor contactors can be vividly seen from the comparison diagrams for making current of capacitor contactor without pre-contacts and with pre-contacts.

1.) Diagram of the making current for CNNK 15 with 15 kVar capacitor (In = 22A; Un = 400V)
Scale: I: 200A / unit;
t: 2ms / unit



CH I: make without pre-contacts
CH II: make with pre-contacts

2.) Diagram of the making current for CNNK 25 with 25 kVAr capacitor (In = 36A; Un = 400V)
Scale: I: 200A / unit;
t: 2ms / unit



CH I: make without pre-contacts
CH II: make with pre-contacts

The capacitor contactors of "Rade Koncar – Kontaktori i relei" DOO – Skopje, series CNNK 2,5; CNNK 5; CNNK 7,5; CNNK10 - CNNK30; CNNK 40 – CNNK 75; CNKM 60 – CNKM 80 have modern design with top constructive solutions fully complied with IEC requirements. They are suitable for controlling of capacitors with order without reactors. Because of the pre-contacts and resistors , the making current is <70 times In.

The backup fusses gl(gG) should be scaled for 1.6 to 1.8 times In .

Features of contactors series CNNK10 –CNNK 75 and CNKM 60–CNKM 80:

- pre-switching on:
  - excellent damping of making current by wire resistors
  - contactors are equipped with pre-contacts for fast folding operating
  - pre-contacts open after the main contacts are closed
  - This is achieved with using the system of permanent magnets, not with mechanical lever
  - single (independent) controlled pre-contacts as a whole increase the resistance of the device from dust
- switching on:
  - no loss of power in the resistors because resistors are disconnected from the current circuit
- switching off:
  - while main contacts switch off, pre-contacts remain hold

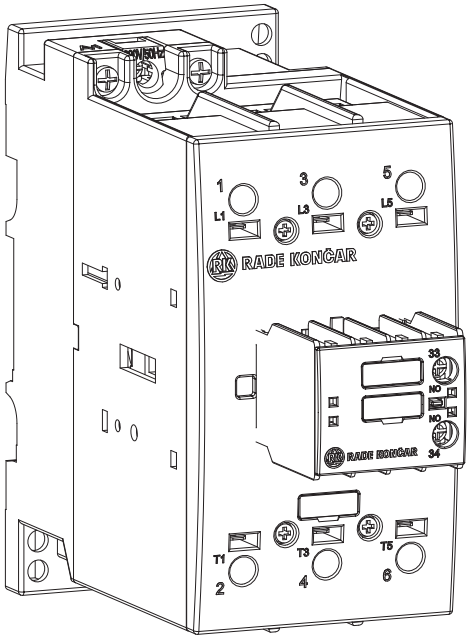
Capacitor contactors series CNNK and CNKM can be used in other cases where high making current exist.

Selection of Capacitor contactor

Capacitor contactors series CNNK and CNKM are selected according to the power of the capacitor. For groups and central compensation, when three phase reactor is not used, it's recommended selection of contactor with a higher degree of nominal value for the appropriate capacitor value.

NEW PRODUCTS

NEW MOTOR CONTACTORS **CNN 150, CNN 110** AND CONTACTORS FOR CAPACITOR SWITCHING **CNNK 80, CNNK 75**



New series of contactors CNN and CNNK

In the year 2020 we are starting a project to develop a new product in our production program. We are starting to develop new series of motor contactors CNN 150 and CNN 110 and new contactors for capacitor switching CNNK 80 and CNNK 75. Our project is in cooperation and co-finance with the Fund for innovation and technology development of North Macedonia.
